Hmm, Poland? Is there anyone there who upgrades STs? I'm going to be getting a 1040ST soon. ;)

Well guys, how about a positive note. I'm old to the Atari world and new to the ST world. Used a Atari 400 modified with a 1200 keyboard bolted to the top and 48K of memory from 1982-1989, though the keyboard is going out big time, it still is really reliable and if my backup computer to my current dream machine, a Atari 800!

Got a Macintosh in 1989, and have used them ever since.
Got a Newton MessagePad in 1995, and have used them ever since.

I rediscovered the Atari world in November of last year. I found that after all this time, there was still a Atari group, the Atari Users of North Texas. I stepped into their group like a guy coming out of a time portal. They helped me get my 8-bit system running (my original drives had died after mulitiple resurrections... however, I might still try to get those percom drives going again someday..) and amoungst my hanging out with them, a new newsletter editor was needed, and so I took on the job, and got the club computer .. a 520 STfm with 4 meg of ram, Cd rom, and harddrive with SLM804 printer.

Nice machine! And I said that before today, when I learned that not only were these good Macintosh-ish machines, but they had COLOR! Damn impressive! Though only 16 color, the ST had some nice games too. (I prefer 2-D shoot em ups)

I am now into everything Atari EXCEPT the Portfolio. :)

I figure someday I'll pick up a Atari TT, Falcon, or another clone. I do look forward to it. Why? Because it is a fun alternative to the standard desktop. Atari's can do a lot of what is out there, and if they can't, they are WAITING for the code to be written, and I see there is a lot of effort being put forth by USERS.

Not quite up to the Amiga, but yet a living platform, the Atari has been quite impressive to me. From what I've seen... still very active in the publishing and music side of things. And then there are us in the Atari Users of North Texas with STs, TTs, Hades, C-Lab Falcons... that just enjoy seeing what this thing can do. :)

Hobby machine? You bet! And here's something more... if you have vendors and people making third party devices... gentlemen.. you have life. In the Newton world, Apple held all technology when the Newton PDA was cancelled. Would not let it be cloned, would not sell the technology for a reasonable price. The Newton users are strong, but we have little hope in site but to modify existing Newtons.

But in the Atari world, look at all the options you have open to you.. the Hades, the Milan, the C-Lab Falcon, and I believe there are several others. Sure, development is slow, but new machines are being made, and

THAT is a large step!

I'm excited with the Atari platform, and all I have to say is.... hey, Microsoft PC's are toasters... tools, utilities. You use them at work, they are no more than a fax machine, a pencil, or a notepad.

But then you come home, and there is a Atari COMPUTER.. the way computers were meant to be... mysterious, and yet fun. A user base that is unique and makes you feel like you are out of the ordinary...

Love it.. it's all fun, and the power is worth the price!

Talk soon,

Doctor Clu

PS: Emulated Atari ST on a PC or Mac.. hey, that is a nice standby
should your Atari hardware go out.. thank you developers.
But true fun is OWNING a Atari or Atari specific clone. :)

I have an Atari St Metafile 30 hard drive. The power supply board has gone out. I can see the parts that have gone bad, but they are burnt and I can't identify them. Does any one have a schematic you could email to me, or does anyone have a similar power board you would sell?

I'm guessing it's a regular 5v+ and 12V+ power supply
any external drive cae would have one...
trace back from the leads going to the drive itself.

Beemn a while since I opened one, but I don't remember anuthing
special about it..

cheers.. B/H

Hi Nicholas (nice name, really!)

Read the Quick FAQ.

Please, newsgroups are not 'write only'. Please read them for a few days before posting questions. You'll find that most of the time, it'll be a FAQ. Then, please read the answers in the newsgroup instead of forcing people who take the time to reply to do some gymnastics, just because you can't be bothered.

Nicholas

You'll find the schematics for one type of PSU in the Quick FAQ. However there were several different models, although all interchangeable between STF/STE and Megafiles. Try finding an old 520STF and cannibalize the PSU.

Hi,
This message is ment for Atari ST users living in The Netherlands.
Therefore, this message is in Dutch. No flames please!!

-----

Hoi!

Ik heb nog een heleboel Atari ST spul waar ik nooit meer wat mee doe
(software, blad STart compleet, blad ST compleet, boeken etc.). Als je
geinteresseerd bent in het overnemen van deze spullen (tegen ZEER laag
tarief) en je bereid bent de spullen te komen ophalen in Bunnik (naast
Utrecht), neem dan contact met me op via e-mail. Wie het eerst komt, die
het eerst maalt!!

Vriendelijke groeten,
Freek Suyver.

Hi folks!

I might get my hands on a STacy in the near future, but I don't know too much about this computer.

1. I know the batteries is a joke, but what's using most power? Is it the HD, the CPU, monitor or what? I guess it would be possible to both reduce weight and power-consumption by replacing the SCSI-card and old SCSI-drive with a IDE-card and a light-weight, modern IDE-drive with powersaving.

2. Memory. I believe the STacy I've set my eyes on is a 1Mb machine, is it difficult to upgrade? A MagnumST would be great, is this compatible with the STacy?

3. Is it possible to connect an external monitor and perhaps keyboard?

The House has a bill set up for a vote ASAP on whether to charge LD charges for Internet access even if you dial-up locally. This is something that affects each of us. Please read and forward:

Congress will be voting in less than two weeks. CNN stated that the Government would, in two weeks time, decide to allow or not allow a charge to your phone bill equal to a Long Distance call EACH time you access the Internet.

The address is http://www.house.gov/writerep/

If you choose, visit the address above and fill out the necessary form! If EACH one of us, forwards this message on to others in a hurry, we may be able to prevent this injustice from happening!

PLEASE PASS THIS ON!!!

Hi Folks,
I expect it is in DoitF030 somewhere but my copy of CAB 2.5 doesn't seem to like the site.....

I'm trying to find out about how the Falcon's DSP port gets external clock sources in. I plan on building an ultra-cheap 44.1kHz only DSP clock. With more people having access to CDR these days a straight mastering system direct to CD makes more sense to me than spending money on a 48kHz option I don't need.....

Yes they should. As for the clock, that depends on whether the XBIOS clock is used, or just the GEMDOS clock. The GEMDOS clock will go on well into the next century whereas the XBIOS one won't without a patch. This appears to apply to all the versions of TOS, as well as Magic 5.11, and probably the other versions.

If anyone wants to know how to patch Magic 5.11 to get rid of the problem, mail me and I'll send you the required info.

I would guess it's the LCD that sucking up the batteries, especially if it's a backlit unit (not sure about that). A 2.5" IDE drive would probably be better, but I doubt that the powersaving functions would be used. Oh, and I don't think there's room to fit any extra cards inside.

Probably not. This is a very compact machine. I've even heard horror stories from people of things falling apart from merely opening it up.

>3. Is it possible to connect an external monitor and perhaps keyboard?

>It is a 550 MB SCSI drive

It depends how it is connected. If you're drive is connected to the
internal SCSI adaptor of the Mega STE, I'm afraid you're in trouble.
The internal adaptor cannot handle, parity and inititor commands....

If You're using a ICD or LINK adaptor, first thing to do is to check
that the terminators are present on the motherboard of the MegaSTE,
they are located where normally the internal SCSI adaptor is inserted

If you're looking for the specs on Your drive try Fijutsi, I used to have two Compac drives which turned out to be Fijutsi OEM...

If all of the above is OK, and it still doesn't work, come back to
this newsgroup and we'll get to step two....(the technical part)

Success

Dennis

Hallo helpful people.

I have got a Falcon 030 without an internal HD. (I use
a Gasteiner SCSI-disk)
Now I have got an IDE-disk from a thrown-away PC. Is
it possible to put it into my Falcon?
I can find these information on it:
CONNER CFS210A
CCA3QAF
BCS01
9429
D62114
The interface/cable has 40 pins.

Thank you for answering!

CHAT ONLINE *LIVE* WITH ALAN CAMPBELL: YEAR 2000 CONSULTANT

Saturday, March 6th 8:00 pm (Central Standard Time... USA)

We invite Alan Campbell to join us to discuss the Year 2000 and how it
will really impact us.

His knowledge of this topic sterms from long term preparation efforts
and has been working with top level individuals at U.S. forms about
what they can do about it. It will be a very good, informative night.

Find out what is going to happen. Find out what you, the computing
user, cannot do without. Find out what the real risks are.

You can ask questions and get answers direct from Alan Saturday Night at 8:00 PM Central Time.

Do you know what your bank will do? Your investments? Your 401K? Your sewage line?

Do you know which dates OTHER than Dec 31, 1999 are endangered? Are you sure?

We won't miss it! Please be there with us online.

HOW DO YOU GET THERE?

Browse to www.AtariUsers.com and enter the main chat room.

You are then able to choose frames or no-frames. This site has been made as CAB friendly as possible. Atari CAB users should use the no-frames link that appears.

This site has also been tested with the common PC browsers and Macintosh Netscape 3.0. While this is a service to the Atari community, others are welcome.

Log in and say hi to whoever is online at the time. Remember that the only scheduled chats are currently Sat. 8:00 pm CST.

This is a big event with a Y2K consulatant is is used to speaking to large gatherings of people. Make it a point to show Alan Campbell a harty Atari welcome!

I don't know if it's the same but I have one of them. It's labeled:

FALCON 14/4 Mb RAM (c)1993 Actionsoft   Made in U.K.

There is a jumper to select 4 or 14 Mb.

I got it new with a 16 Mb SIMM (cannot make out the manufacturer,
something like "TI KOREA", not the Texas Instrument logo). It still
works fine 3 years later (well, I use a Magnum for a few months).

Bye,
/Pascal/

Well, I looked it up in your DOIT archive, I think I now see what went
wrong: I also need to remove R221, R222 and R216
I overlooked that in the text I originally used (in the CBHD manual),
as I had no German dictionary at hand at the time...

: How do you get this bullshit???
: A normaly standard DIL chip with the case sign left hand case
: have that pin out:

: Kick people they gave the wrong pin out to you, thank god your
: falcon lives.

Hmm, yes. The wiring was correct though, I just typed the wrong pin numbers
(that was from memory, and I am not accustomed to working with IC's).
Sorry...
But thanks for the correction :-)

I'm not sure if this typ of IDE device will work perfectly.

But you need an cable adaptor from 2.5" to 3.5" if you like to connect a normal pc style 3.5" IDE device. Falcon internal IDE connector is build to connect 2.5" devices.

Falcon IDE cable must be short as can! No buffers!

Watch out for IDE power surge, Falcon internal PSU doasn't support old and big devices with 2Amps and more!! Use and external PSU for older devices!

All what you must know about internal IDE connection you found in DOITF030. (And a lot more for falcon hardware)

Regards, Robert

Or some else.. Some drives are have jumpers to synconisize
the motor/SCSI with other devices. But you only need this
jumper if the device is in a raid system. (Device cluster)

There must be some information on the CDAR 504. Is this the really large
looking unit with push buttons and remote control? You need to find the
origin of the unit. Isn't it a converted CD PLAYER for audio disks?
You could try a stereo repair shop. When you say died, do you mean no power?
As in fuse, or powersupply problem? Hey, a trip to Vegas is never a bad
thing:-). And at least he said BID on one and not BET on one:-).

Hope this pathetic bit of moral support helps. If not I would be willing
to buy it. I think they look neat, even if not working.

Later Brian.

The Magnum ?

The Falcon Magnum plugs in the extension port and allow you to use 4 or 8 Mb of Fast RAM. You cannot use more than 4 Mb of ST RAM with it.

For more specs, have a look at:

http://www.aixit.com/

I have an older ST floppy drive with the very large eject button and
a red activity light. 18 pin connector - group of 14 + group of four.

Can anyone tell me what type it is, or perhaps how to find out. Maybe
a serial number somewhere inside? Many thanks CJ__

which one? the simm currently in the board or the prospective replacement?
I've not tested the one in the board (well, it works doesn't it?) and all
the replacements tested were new.

X-Admin: news@aol.com

I couldn't access the FAQ page today so here I am to ask these questions direct.

Out of curiosity, I opened up the case to my ST4 to see what the rectangular removable cover was for that is on the back of the unit above the midi and monitor ports. But all that did was raise more questions, such as:

1) What is the 64 pin connector for?(J15 on the motherboard)
2) What is the 24 pin connector for?(J17)
3) What is the 6 pin connector for?(J18) It resides beside the internal PSU connector, is this an addition power connection?

All of these connections on my computer are empty and unused. If these were for future upgrades what peripherals/addons took advantage of them?
Any light the NG can shed on this for me would be greatly appreciated, this not knowing is killing me.

thanks in advance,
Brent

Hi, as someone who's rarely used his ST in the last few questions I've got a couple of questions to ask before I buy a Falcon I've been offered.

1 Is 200 pounds a good price for a 4MB machine with 127MB Hard drive?

2 Has anything ever been developed for the Lan port?

3 What is the easiest/cheapest/best way to give it more Ram??

4 What are the best currently available ways to upgrade the performance of the machine (other than adding an FPU) ? Perferably ways that don't require too much soldering... I've seen all the problems people seem to be having with Nemesis...

now to consult the bank and see if I can afford it.....

Cheers,
Thomas

Some disk drives with the large central button are double sided! That doesn't help if you don't know what you are looking for.

If you can format a disk double sided, if you get a 'device is not responding' type of error message try formatting it single sided (it's more likely a single sided (360k) drive.

Not matter what type of drive you have the plug the Atari uses is called a Schugart interface, which is a 34-pin connector. All odd numbers are grounded, so if you plug it in the wrong way (upside down) no damage should be done; you will notice the drive is constantly spinning and will not work or register with the Atari.

Some older drive have an adaptor that is either attached to the shielding or directly to the drive, the ST's plug will plug into that. If you later upgrade the internal drive you shouldn't need this as most modern (if not all) drives have this as standard.

I hope this is of help.

Hi, everyone.

Some time ago there was a discussion in this newsgroup concerning the overclocking of a standard 8MHz MC68000.

It seems there was an agreement that, with a little luck, a standard 8MHz CPU may work happily on 16MHz. I AM QUITE AWARE that without a cache the gain in performance is very slight (some say about 10-20%) but I am willing to try this modification because:

a) it is very simple and cheap: just a couple of TTL chips;
b) the MC68000 in my Mega is already sitting in a chip-socket, so I would not have to desolder it.

However, I would like to make the improvement as efficient as possible, while keeping it simple, so I analyzed the operation of two 16MHz circuits that I found on the Hardware-Hacks page:

* CPU is switched to 8MHz by AS active or UDS/LDS active for bus access- seems VERY reasonable, as the MMU and RAM would not follow the 16MHz clock;

* Mario Becroft suggested to me that ROM access might be done on 16MHz, with a noticeable speed improvement. Seems reasonable, too; maybe I should inhibit switching to 8MHz while ROM-select lines are active; does anybody have any experience with this? I guess that my FPU can also be accessed on 16MHz then?

* Both circuits also switch the CPU to 8MHz while BG (bus grant) is active.

The last item I DO NOT UNDERSTAND! Documentation for the MC68000 says that when the CPU gets a BR (bus request) from some other device on the bus, it responds by putting its outputs into high-impedance state and activates BG (bus grant). Then it finishes whatever internal operation it was doing (for example, a multiply or divide) and after that waits for the other device to release the bus by releasing BGACK (bus grant acknowledge).

My question is: why should the MC68000 wait for bus (doing almost nothing) switched to 8MHz-clock (and complicate the circuit by the way)? What particular chip in the Mega would require this? Mario B. suggested that slowing for BG was not needed, but he said he did not test it thoroughly. Any comments / experience on this?

If it is not necessary to switch to 8MHz while the Bus is Granted, then the CPU would be permitted to finish any internal operation more quickly, squeezing out a maybe a percent or two better performance. Then, the logic for switching between 8MHz and 16MHz would be something like this, still quite simple:

```
Switch CPU to 8MHz IF
  there is a bus access (AS active)
AND NOT
  bus-granted OR rom-select OR fpu-select
```

Please, advise.

Cu.

Can anyone tell if it is possible to use a Hand scanner with an Atari Mega ST?
The only hand scanneres that I can find are the ones used for the PC's. I

have not been able to locate a scanner that will work with any atari computer.
If anyone has a glue where to find please let me know.
Thanks

Well, it just needs one normal 72 pins SIMM. Maybe EDO can work, I don't
know cause mine is older. AFAIK, the Falcon needs RAM faster than 100
ns. So 70 ns is ok (that's what I have), better use 60 ns for an
accelerated Falcon.

Is it the info you're looking for ? :-)

Bye,
/Pascal/

Not very often. In my experience with clock switching 10MHz version performes most reliably
(yes, even more than 12.5 and 16 MHz versions). This is because you should not vary clock frequency
to ordinary MC68000 while operating. I did it several times, but things are not so simple and they involve
certain amount of black magic in some cases, like fine phase shifting of 16 Mhz clock before multiplexing etc..
Right way to do it would be to influence DTACK, VPA, VMA, E, UDS, LDS and AS signals to emulate
8MHz timings with high clock all the time. I think that was the way described in German C'T magazine...
However, if you decide to try your luck with clock multiplexing, I would advise you to try with 68HC000-16, because

it has static design and so clock speed does not matter as long as it is lower than or equal 16 MHz....

Depends on ROM speed, but you can certainly try that. I have 120ns EPROMS on my TOS-IDE card and because address decoding for TOS 2.06 is done on card itself, the rest of
the computer does not even react on memory access cycle that hits TOS2.06, so as long as decoding logic
and EPROM's are fast enough it works on 16MHz, but I don't know about old TOS versions that are decoded
through GLUE... You can definitely try.

>

I think it's some kind of mistake. Only device that I know of in ordinary ST that might request bus
is Blitter, but that would be at highly irregular intervals and besides that many ST machines do not have it...
I would think about switching clock into high gear only when CPU is doing nothing on the bus, which would be
when CPU's BG is inactive AND all strobe lines are inactive or at least some of them (AS OR (LDS and UDS))or when
CPU is reading TOS 2.06 EPROMs....
Note that there is difference in AS and UDS/LDS timings. Later two are activated a full cycle later during the write cycle, so

using that might mean a few % more speed, if machine accepts that...

> quite simple:

Prepare yourself for many strange effects, like slight variations in the machine speed, depending
on the machine temperature, intermittent lockups, etc. But with a little luck it might even work.

>
>
> Switch CPU to 8MHz IF
>   there is a bus access (AS active)
> AND NOT
>   bus-granted OR rom-select OR fpu-select
>

I would define criteria for 16 MHz work rather than for 8 MHz.
I would say something like that:
switch to 16MHz only if:
-BG is active (since then CPU is doing internal op's anyway- might help during long DIV instruction...)
-or if BG is inactive and:
    -bus is inactive (AS or LDS/UDS, try both combinations)
    -or bus is active but adress is in range of 14-15 Mb (TOS 2.06) or maybe 12-13 Mb (old TOS if memory serves me)

If you want to further complicate things, you might want to add input for turbo switch, but it should be latched, since frequency swithing
is possible only at certain moments and not whenever you please....

Good luck,

Brane

Hi

There are scanners for the ST's, but I don't know if they will work on
the Mega series. All the ones I've had use the cartridge slot.

Yes, that sounds like an adequate price.

> 2 Has anything ever been developed for the Lan port?

The LAN port is actually a serial port in disguise. You can use modems on it, as long as you use a Mac type cable.

> 3 What is the easiest/cheapest/best way to give it more Ram??

A second hand RAM board would be the cheapest, either the Atari one or a 3rd party SIMM board, but these are all hard to come by.

> 4 What are the best currently available ways to upgrade the performance of
> the machine (other than adding an FPU) ? Perferably ways that don't

> having with Nemesis...

The best way seems to be the CenTurbo II board, but it costs the 300 pounds. It also includes a RAM upgrade that adds TT ram (faster and more expandable than the 14Mb of ST RAM).

> now to consult the bank and see if I can afford it.....
>

Go for it, but don't forget you'll need a VGA monitor to go with it.

Does it work at the same speed as the modem port? And can I just use a
normal modem as long as the cable is right or do I need a Mac type
modem??? (Ignorant me!)

> > 3 What is the easiest/cheapest/best way to give it more Ram??

Are there any other options? Since I don't think my chances of finding
them are great.

> Go for it, but don't forget you'll need a VGA monitor to go with it.

Thats ok, I've managed to find a PC owner with one too many monitors...

Thanks

Once upon a time there was plenty of hand-scanners available, but now I don't think they make them anymore. I have an old Daatascan scanner myself, and it works flawlessy on all my Ataris. It has been used on a STE, a MegaSTE, a TT, a Falcon and a Mega ST.

Does anyone have a complete list over TT-high compatible monitors made by Atari? I know about the TTM194 and TTM195, but I wondered if any of the other monitors (i.e. the ones made for the Megabus graphics-card) was compatible. I vaguely recalls that they're not, but right now I need to know for certain ;-)

It's a 115Kb/s port. There is normally no particular difference between a Mac modem and a PC modem except the cable. I'm not talking about those silly "WinModems" of course.

Nope. The Falcon uses a proprietary memory connector, so it's going to have to be one of the above. 3rd party board are avaible new from several dealers in the UK. Not sure about the prices, but it should be around 30 or 40 UKP, plus a 16Mb SIMM.

> > Go for it, but don't forget you'll need a VGA monitor to go with it.
>
> Thats ok, I've managed to find a PC owner with one too many monitors...

Oh, and a VGA adapter. The Falcon uses a special monitor connector that needs an adapter, whetever kind of monitor you decide to attach to it.

Are these the Marpet boards?

AFAIR, they need TOS 2.06 to work & you must have 4 Megs on the main board already. Don't they need a square (PLCC) CPU, which (AFAIR) was in the STE & Mega STE only?

If by 'put into' you mean internally, with the case on, you need a 2.5"
IDE drive eg from a notebook type computer. If it is 3.5" you need an
adapter cable and house externally

Why not try to get OUTSIDE. this is Software that allows allocation of
at least part of a partition to be virtual RAM. You can tag each
application to run in and/or take memory from virtual memory. Magic has
a special loader to work with it. I think that there is a demo available

PD that is limited to the size of VM.

Have you considered the flat bed scanners. I have one (PrintTechnik)
from Germany, (a modified scanner/copier) that couples to the printer
port of my MegaST4 and directly scans into Calamus 1.09n and Megapaint 4
Pro. It is mono 200dpi and up to 16 dithered grayscale. I tried to sell
it on this board but no luck.

I remember the Mega ST-version (Marpet) from a test in ST-Format. It was a
huge Megabus-board with 8 30-pin SIMM-slots, it will only work if the ST
already has 4Mb. I believe the MagnumST will work with a Mega 2ST, but I
can't say for sure.

Actually both the LAN and serial-port is capable of 230Kb/s :-) A normal Mac
modem-cable can be used to connect ordinary modems, but the LAN-port is not
supported by all software.

Sure, with some shoe-horning ;-)

If you're coming to Trondheim next weekend you can see how it's done in my Falcon. It's also possible that I can hack together the required cable for you.

Brian Van Tilborg <madmax@bfree.on.ca> wrote :

>Has anyone installed the 8meg RAM boards and if so how do they work? Any problems. Are they useful? Do they work with the Mega 2s?

A couple of months ago I installed one for someone I know, but let us not make any mistakes here, there have been several boards on the market. AFAIK the only one for sale now is the MAGNUM RAM expansion board..... The Magnum card comes in four flavours: the MAGNUM ST for all ST's and Mega ST's, The MAGNUM Falcon ,the MAGNUM TT and the MAGNUM STE for the Mega STE, the 1040STE computer is not supported.. Only the MAGNUM ST card needs a bit of work done:

The board has four sockets: one for the 68000 processor, one to hold a 8Mb or 16Mb SIMM and two for TOS 2.06 If the processor on the motherboard sits in a socket (very unlikely) then installing the board is a straightforward five minutes job. Supposing the processor is soldered on the mainboard, it will have to come out and be replaced with a socket. You can desolder the processor very carefully or do it the "rough way": cut of the legs from the processor and solder the socket straight onto the legs, the last method ruins the processor, but is a lot easier to do. The price for a new 68000 is very low.

The card needs TOS 2.06 to be able to see and use the extra memory, if TOS 2.06 is already installed on the Mega ST, take them out and put them on the board, if you still have TOS 1.02 or 1.04 installed leave them where they are, but you will have to buy a TOS 2.06 to put on the board.

The extra memory is handled as FAST RAM, when you install a 8Mb SIMM you will have 10Mb in Total => 8Mb Fast Ram + 2Mb normal Ram.

All that is left to do now, is to solder one wire to a pin on the DMA-chip, and if TOS 1.02 or TOS 1.04 are installed and you want to be able to do TOS Switching you'll have to solder about 6 wires to different legs of the ROMS. I can't recall what legs but the board come with a very detailed manual. If you don't want TOS switching, remove the TOS, and you dont have to bother about soldering the wires to the different legs either...

Basicaly that's it so cross your fingers and start up the computer, the first thing You'll notice is the TOS 2.06 Atari Logo, press space and go to the desktop. The board comes with a disk containing two apps for the AUTO folder,they have to be the first apps in the Auto folder. Reboot again and let TOS 2.06 do the memory test....you should have 9, 10 or 12 Mb depending on the ST RAM which is on your motherboard

So, if your processor is socketed, all it takes is soldering just one wire. otherwise you have to install a socket for the card, this can be a bit tricky if you never soldered anything before in your life.

The board is installed now for over 6 months and AFAIK everything works

just fine. Sometimes a app doesn't run, but that's because of TOS 2.06, if
you install the TOS Switcher, no problems.

Take a look at http://www.aixit.de for some more info

The card can be bought from SEIDEL Software Service, 199DM for a bare
board
and 279DM for a card with TOS 2.06 and a 8Mb which in my opinion is very
cheap compared to what a normal memory upgrade costs, they do
international
orders and take credit card. http://www.seidel-soft.de

Oh yes, a new 68000 cost 7DM

If something is not very clear yet, just drop me a mail...

Cheers from Belgium

Dennis

I have here the Atin memory board for Falcon
Uses 4x 4 Mb SIMMM 30p (old type). Old 4 Mb board out, this one in.
When using low-profile SIM's they fit in the casing. Otherwise you

are a few mm. short (with the keyboard).
Sell the bare boards for cost of production and garantee: not working
send back, money back.

For the STE there was the SM 194. Same factory as TTM 194 but with
some slight changes for other pixelclock and linedrivers (soldered
jumper configurations)

I read that the Mega ST 2 has a

"MegaBus Expansion Port"

[http://www.netlink.co.uk/users/markn/16Bit/megast.html]

What "expansions" can be put into this port?
(I already have a ACSI->SCSI adapter).

Thanks in advance

At

http://www.netlink.co.uk/users/markn/16Bit/16bitcom.html

I found some other hardware things which I never heard of
(until recently I didn't hear much about the ATARI hardware sector,
I just had my 1040 STF and used it for years):

Atari STacy: is this a kind of ATARI "laptop"?
Is it still out there?
Looks like heavy stuff ;)

Atari STylus: "never released" - was this at the end when
ATARI hardware production was closed down?

Atari STBook: no more information at the above WWW-site.
Was it released?
Is it still out there? It looks quite neat.

Atari Portfolio: looks like a Psion ;)
Any more informations about this item?

Atari ATW: are there some of these out there?
I heard from my colleague that colleagues of him were building
compilers for this machine in those days.
He was not sure, if they finished this work.

Thanks in advance
ME

yes i have one it's just an stfm with a mono lcd screen,built in hard

drive,quite heavy,battery is a waste of time,they still fetch good money
as they are getting rare and are popular with musicians like myself,i
have put a 1 gig drive and a hd floppy in mine

Only 350 ATW's were ever made.
If I had the money 6 years ago I would have bought 1 from
ACN in the Netherlands, when they were sold out for a fraction
of the original price.

Mine is not EDO. I don't know about its parity but AFAIK it's not a problem with Ataris. The SIMM is single sided (ships on one side only), its speed is 70ns. For more sensible details, Robert is the good person to ask.

Good luck.

Bye,
/Pascal/

Hi Walter,

I once developed an interface for Logitech-Handscanners (256
Greyscale-type)
It worked together with REPRO-STUDIO on all Atari-ST/TT-machines.

If you are interested look for the German magazin ST-Computer. In one of the next numbers I will introduce the interface and the software.

In the meanwhile: maybe one is offered by an user who doesn't need it anymore?

Greetings

Hey Hey. I have a Migraph hand scanner that was bought new from Toad a few years back. Hooks up to the cartridge port, has Touch Up software for scanning, (requires 1mb ram but the more the merrier, and a HD. Software runs on ST, STe and TT's that meet these requirements. Can't guarantee Falcon compatibility.) and a 'demo' version of Migraph OCR. (It won't load images. Only takes input hot off the scanner.) Good condition, pretty much used only for one project. Its a monochrome scanner, up to 400dpi, has a line art mode, or can do dithering internally inside the scanner, but this brings down the effective DPI quite a bit. The Touch Up software can fake greyscale by reducing the image and averaging pixels, though a PC with Photoshop can do a much better job of that... :) http://members.xoom.com/scanner.html I've jumped ship to the Power without the Price of today, a nice homebrew PC... considering $50 can get you a color flatbed parallel port scanner these days, (rummages though wallet, "Hey, I have $50...") its really not worth it for me to mess with anymore...

Hmmm, I have a scanning tray for it too.

Didn't Moniterm make a 19" monitor at on time? Or was it just for the ST/e line?

This one was released, but is still very rare. Those who have one cling on
to it or sell it for $$$$$$.

>Atari STylus: "never released" - was this at the end when
>   ATARI hardware production was closed down?
>

No, it was well before the Falcon. A sort of Newton, years before Apple or
the Palm Pilot.

>Atari STBook: no more information at the above WWW-site.
> Was it released?
> Is it still out there? It looks quite neat.

There are some rare pre-production units. I think it had a problem with
battery technology. All of the above were ST based.

>Atari Portfolio: looks like a Psion ;)
> Any more informations about this item?

It's an 8086 PC XT with DOS in ROM. Again, years before anyone else had the
idea of palmtop PCs.

>
>Atari ATW: are there some of these out there?

>   He was not sure, if they finished this work.

Again, proto or pre-prod units were built. The ATW was actually driven by an Atari Mega ST which was used as an I/O board for the transputer.

OK...this is a bit of an advert, but Abingdon Synthesis Projects do a coinverter for the Falcon IDE port to 3.5" drives....it's called the IDE-Burster, and the standard installation set that you need is 10 UKP to post to Norway. I would need funds in UK pounds though as I have no foreign

currency account with my bank. Alternatively I am willing to swap for
interesting hard or software....I do stuff for Atari's not to make money,
but becasue I love them so much :-))

ACN sold with IO and 1 farmcard incl 4 T800 for EUR 820.

A few weeks later I saw (I couldnt believe my eyes) a wrecked
ATW800 with all its guts hanging out, in a obscure junkshop.

The boss wasnt in and the bloke that was couldnt tell me anything
about it. I am not a technician, so I left it there.

A true horrible experience of which I occasionally have bad dreams.

Henk.

Of course, WinModems are internal by definition, and kinda hard to plug
into anything but a PC anyway. :)

Callum Lerwick (PC service tech, who gets to deal with lusers's
nonfunctional winmodems, among other things.)

ATW (800) = Atari Transputer Workstation. The super computer that could have..... Housed in a full tower case the system board allowed for plug in multiprocessor daughter cards utilizing T800 RISC chips capable of massive parallel processing. I believe they shipped with Atari System V Unix (really does exist!) originally. I would almost kill (not really) just for the System five OS.

No, Atari Unix System V was initially planned for the TT much later. Actually the ATW was supposed to run the Helios parallel OS. It had a Mega ST attached to it which was used for all the I/O stuff, keyboard, video, etc... I seem to remember that the OS was hardly ever finished and there was definitely no specific software for it, although the Mega ST part of it would behave exactly as a normal ST.

Hi

I'm in need of a couple of good quality external SCSI cables (centronics style).

I'm a little low on cash at the moment, so can offer 20GBP's worth of Atari software/hardware, PD software or the first (this is what I am told) CD-ROM for the Atari.

Yes, its possible for both hand scanners and other scanners which
connect to the cartidge port on the ST series to be used.
Migraph made the most popular model of hand scanner
along with Golden Image and I think there was a 3rd brand
but the name I can't think of right now.

>   Looks like heavy stuff ;)

It was basicly a 1040 packed into a portable box with a screen
that worked like the monochrome SM-124 monitor.
Batteries never worked well on this, it ate thru them too quickly but
was very popular with musicians and MIDI.

>Atari STylus: "never released" - was this at the end when
>   ATARI hardware production was closed down?

Only have sceen pictures of this one.

>
>Atari STBook: no more information at the above WWW-site.
>   Was it released?
>   Is it still out there? It looks quite neat.

Never sceen it in person, but have sceen it in a number of
photo's and somewhere I think I got a brocure that Atari made
for it. It was only sold in limited numbers and never went into
full production. Nice machine, but it has no floppy as they
tried making it more energy effecient than the Stacy made
a number of years prior. Much better (Clearer) screen than the Stacy

>Atari Portfolio: looks like a Psion ;)
>   Any more informations about this item?

This was one of the First palm held PC computers, it runs on
AA batteries and is PC based (8088 or simliar chip)
Sold well for awhile, but then HP got big into these and
Atari did nothing on releasing newer faster models..
Sort of trying to sell a 286 system after 386's became the
norm and 486's are starting to come out..

>Atari ATW: are there some of these out there?
>   I heard from my colleague that colleagues of him were building
>   compilers for this machine in those days.
>   He was not sure, if they finished this work.

Yes, there were some of these release. I think they used special
software. I know of one guy who was in a user group that I use to
belong to in San Diego who said he owned one for awhile and traded it
for a TT I think. These are very rare, but theres a few web pages out
on the net telling you more about all of these models.

Search on Yahoo or another search engine for Atari, TOS or
other names and see what you find.. You can spend awhile
getting thru all the good Atari pages out there.

Glad to see others still enjoy there Atari computers as do I.

Mike

That's about all that was available. It's a proprietary port. There may
have been some graphics adapters too, but that's about it.

:)
On one hand these machines are like dinosaurs (age)
but otoh they are not (they don't die) ;)

ME

P.S.: I won't tell this story to my colleague - he's
a hardcore PSION fan and I guess he would hang himself...
;)

Sounds like a very interesting machine.
If only 350 ATW's were ever made, it will be quite difficult to get a hand
on it though...

I can get a virtually unused SM194 very cheap, do you know if it's possible to modify it to work with my TT? If you have any schematics or specs on those jumpers I'd be very grateful, a step-by-step-DIY-convert-the-SM194-to-a-TTM194 woulb be even better :-)

There was atleast two other scanners, Naksha made atleast one and then it was the Daatascan. And what was the name of that Falcon-only colour-scanner?

I believe your SCSI-adapter is connected to the 20-pin port at the rear left in your Mega. This is a duplicate of the ACSI-port at the back, and not the Megabus.

The Megabus is basically just the entire CPU-bus on one connector, but it was not used very much. The only accessories I can recall that use this bus is Atari's own graphics-card for the SM194/Viking Moniterm 19" monochrome monitor, Titan's Reflex graphics-card, some old ET4000 graphics-cards, Marpet's 8Mb RAM- card and perhaps an ethernet-card.

Actually, the Inmos T800 wasn't a RISC-chip, but a transputer which is an architecture of it's own. I found some info at...

  http://www.cs.jcu.edu.au/~ling/transputer.html

> massive parallel processing. I believe they shipped with Atari System V
> Unix (really does exist!) originally. I would almost kill (not really)
> just for the System five OS.

It was shipped with Helios, an OS which still is used and partially supported by some individuals. The ATW does have a network-card (optional?) and a pretty complete C-compiler so it can still be used for a lot of things. And it runs X.

There is a lot more ATW-info at...

  http://columbia.digiweb.com/kiffer/ATW/main.html

Btw. I actually saw one of the original ABAQ prototypes at Microdata '89 in Oslo, it was an impressive sight for an owner of a poor 1040ST :-) It was connected to a 19" colour-monitor running X and some X-demos at an (for the time) incredible speed.

Hi folks,

MiGraph made the ColorBurst Color hand scanner for the Falcon.
I have one and it does a pretty good job. (Uses the parallel port)
According to the manual it is a 18-bit color hand scanner that will
scan images in 262,144 colors, 4096 colors, 64 true greyscales and
monochrome.

The Super Color Scan Mode reads 262,144 colors in resolutions of
50/100/150/200 dpi.

Color Mode reads 4096 colors in resolutions of 50/100/150/200 dpi.

Monochrome Grey reads true greyscales with 64 levels in resolutions of 100/200/300/400 dpi.

Monochrome Text will also do 100/200/300/400 dpi.

I think the software will also increase the 64 grey scales up to 256 shades when saving out to a .TGA or TIFF.
It also came with some OCR software.

It's a nice looking scanner. The software lacks alot of options. Mainly it just allows you to scan, clip, and save your images. The file support is good though. Allowing scans to be saved in TGA, TIFF, .IMG, and .IFF. Which can be loaded into just about any good Falcon graphics software for editing or etc. Apex Media, True Paint/True Image and others are good for editing/file conversion.

Also I have the Golden Image 64 grey scale hand scanner that I have used on a 4 meg STe with Tos 1.62 with the most excellent Touchup software. The scanner uses the cartridge port and according to the box works on all the ST and Mega Atari computers. Not sure if it will work on the Mega STE or TT. I know for sure that it will not work on the Falcon due to incompatibility with the cartridge port. Migraph was suppose to make a cartridge port adapter that would allow these types of hand scanners to be used with the Falcon. Not sure if any where made or not. I post a question about the adapter along time ago in CSAST but got no replys on it.

With the Touchup software you can do 256 greyscales. The Golden Image hand scanner supports 100/200/300/400 dpi. And does a excellent job. It's Great for doing a Black and White newsletter or any DTP work. The GreyScale scans look very good on a Falcon. Touchup has GDOS support and printing ability built in.
Many nice editing functions and drawing capability. Although the these type of scanners are monochrome or greyscale only. And Touchup does not support color. Only monochrome and greyscales. Also Touchup has many file supports such as .TIF, .IMG, IFF, and even .GIF. Deluxe Paint on the ST can be used to color the 16 level greyscale scans that you can save out with Touchup. Falcon graphics software can also be used to color and edit the 16, 64, 256 levels of greyscale scans that can be saved out with Touchup.

The Touchup Software is Falcon compatible. I have version 2.52. Not sure what the last version is. Would like to know.
Also have the SCAN n SAVE hand scanner software that runs as a Accessory on the ST series. It is just for doing scans, no real editing features other than clipping your scan. Nice for doing scans when using a DTP program like PageStream and etc.

I am considering selling the Golden Image hand scanner with the Touchup/Scan n Save software. It is in excellent condition with

all manuals, instructions, newsletters and etc.
It has been stored in its original Box for awhile now. I'm
using the ColorBurst scanner on the Falcon for my
scanning needs and don't really need the Golden Image one.

I think there was some other scanning software for the ST and
maybe the Falcon called GT Look II or something like that.
Not sure what scanners it supported. I seem to remember that
it was fairly expensive.
Anyone have details on this scanning software and the scanners
it supports? Is it still available to purchase?

Thanks,
phantomm@eastky.net

Can the Iomega ZIP Plus be used with an Atari 1040 or Stacy? Email with reply, please.....I tried it with my Mega 4, and I've forgotten how to create a new drive for the computer to see the Zip. The drive does have SCSI, by the way, so that's not it.

Thanks,
Steve Nelson

Hi,

I have a Matrix TC 1203 or 8 (Can't read the label) with a DB-9 female connector on a TT030.
I tried using a DB-9 Male to HD-15 Female adaptor to connect it to my SVGA monitor. But no luck..

Can anyone help out? Any Ideas?

Thanks in Advance...

>Note that there is difference in AS and UDS/LDS timings. Later two are activated
>a full cycle later during the write cycle, so
>using that might mean a few % more speed, if machine accepts that...

I am aware of the one-period difference. But maybe the MMU expects it to be just so, in order to do WRITEs correctly?

BTW is there somewhere a source available where one can find COMPLETE description of MMU's operation? Internal counters, timings, etc...

>Prepare yourself for many strange effects, like slight variations in the machine
>speed, depending
>on the machine temperature, intermittent lockups, etc. But with a little luck it
>might even work.

Of course. I wouldn't be surprised if it didn't work at all.

It seems to me that your and mine conditions are logically equivalent,
except for the fpu bit.

>If you want to further complicate things, you might want to add input for turbo
>switch, but it should be latched, since frequency swithing
>is possible only at certain moments and not whenever you please....

That is understood. Manual switching has to be correctly synchronized. And
I think that there MUST be a manual switch, just in case...

>Good luck,
>
>Brane

Thanks for the useful information.

>> Can anyone tell if it is possible to use a Hand scanner with an Atari Mega ST?
>> The only hand scanneres that I can find are the ones used for the PC's. I
>> have not been able to locate a scanner that will work with any atari computer.

I have a Logitech Scanman b/w hand scanner that is connected to the cartridge
port by an adaptor, and using an external power supply (12V 700mA).
It scans up to 400dpi. I bought it second-hand without any documentation, so
I do not know about the number of grayscale levels, real or emulated. The
connector on the scanner cable is identical to those on PC scanners
(small round one with a lot of pins), so I guess that just the adaptor is
specific to the Atari.

The drawback of my scanner/adaptor combination is that apparently the
only application with a driver for it is Repro Studio Jr (not very good).

BTW. I got the scanner with a stupid unregulated power supply containing
just a transformer, a rectifier and a condenser. I added a 7812 voltage
regulator into power supply and that improved the quality of the
scanned pictures significantly.

On 8 Mar 1999 14:55:17 +, BobKing wrote:
>Have you considered the flat bed scanners. I have one (PrintTechnik)

>Pro. It is mono 200dpi and up to 16 dithered grayscale. I tried to sell
>it on this board but no luck.

I have tried this scanner and didn't like it very much. The 200dpi
resolution can be very awkward if you want to print at 1:1 scale in
300dpi resolution- software magnification by 150% just never works right.
And the resolution is not even 200dpi. It is, if I remember correctly,
195x205 dpi (same as on a fax machine), so that it distorts each
picture slightly.

Generally speaking, though, flatbed scanners are much easier to use
than handheld- if you have enough desktop space.

>Marpet's 8Mb RAM- card and perhaps an ethernet-card.

It is not EXACTLY identical to the entire CPU-bus, though the pin layout
is very similar to that on the dual-in-line MC68000. But there are no
+Vcc pins on the Megabus, and some of the bus-arbitration signals
(I think BG) do not come directly from the CPU but through a couple
of additional chips.

I think there were several FPU cards (one made by Atari) that fitted into
this port.

Cu.

I wish you good luck in finding 4Mb 30pin SIMMs. These were never
standardized and therefore, if ever you find any (they are quite rare),
you might have to deal with compatibility issues. I would suggest
finding the SIMMs first, then ordering the Falcon board.

Nick

Yes, it works as a SCSI device with a SCSI host adapter, NOT on the
parallel port.

You don't actually "create" a new drive, you add the icon to the desktop
and maybe format and partition the drive with AHDI (not sure how well it
handles Zips) or HD Driver (strongly recommended for Zip drives).

> Thanks everyone for your help.

There are several pages that will tell you all you need to know to get
on the net with an ST, including the Quick FAQ and
http://www.acay.com.au/~stevebj/sting.txt

Basically, you need
Hardware

-At least 1Mb RAM (more if you want to browse the web comfortably).
-A hard drive (you can use a floppy, but where will you store you email messages? and browsing the web is way toooo slooooow).
-A Modem (more than 14.4K is pointless on an unmodified ST).

Software
-A proper serial port driver: HSModem
-A TCP/IP stack and dialer: STinG
-A mail/newsreader: Newsie
-A WWW browser: CAB
-Any other client, FTP, IRC, telnet...

Follow the instructions delivered in the Quick FAQ and you should be set...

The story behind this is as followes:
Jeffrey Willemsen is an active contributor to the magazine and the Stichting.
To have bread on the table he works with a big firm that repairs all kind of computer stuff for bigger firms.

They were offered a contract for taking care of many b/w monitors.
They did not want until Jefferey told them that Moniterm monitors are
also know as Atari 19 " b/w screens.
And that he knows how to get them (working or for spare parts.)
I have here 2 TTM 194 and a SM 194. Working but not in a good
condition at all.
He takes them, I buy other (better) ones, I can deliver maybe more of
those and everybody is happy.
He told met that that SM 194 was also welcome because it is the same
except..... (technic talk, not reproduceble).

But I will ask him to get the info on paper.

I Holland I sell thenm for Hfl 25,-.
As you sure know :-) a Hfl is 2.20371 Euro.
And without doubt you know the Pound/Euro exchange rate.
Put some extra with it for the postal stamps *about $1 to keep it
simple* and you have your cost.

I send you the card when I have an adress, wait till I hear from you
again and if it works we can figure out how to get the money here.

> 8MHz CPU may work happily on 16MHz. I AM QUITE AWARE that without a cache
never tried to overclock an Atari 68k, but some i desoldered from old MACs
only went til 12MHz.

how ever i got me a 16MHz 68k and put it in my ST - never took the time to
optimise this, but all internal accesses e.g. DIV & MUL run at 200%
(what's of course quite reasonable, if you asked me as i double clock it)

> * CPU is switched to 8MHz by AS active or UDS/LDS active for bus access-
>   seems VERY reasonable, as the MMU and RAM would not follow the 16MHz clock;
i too tried to improve RAM access as i have a 4MB F030 board in there and do not
see the reason why it couldn't be read/write with 16MHz i.e. an access would be
at least 2-3 clock cycles = 64.5ns * 2 = 125ns so i'd expect an 80ns RAM to be
quite sufficent - however the ST never booted with a 16MHz driven RAM.
74LS244 bus drivers too slow ?

> * Mario Becroft suggested to me that ROM access might be done on 16MHz, with
>   a noticeable speed improvement. Seems reasonable, too; maybe I should
>   inhibit switching to 8MHz while ROM-select lines are active; does anybody
>   have any experience with this? I guess that my FPU can also be accessed

>   on 16MHz then?
i have only a quite simple TTL circuit to switch 8/16MHz but tried to double clock ROM - for some strange reasons - gembench gives 114% on ROM |:

to be precise if my circuit works right 16MHz should be on ROM access and CPU internal access. 8Mhz on all other periphal accesses (e.g. the PSG shall gets a too "long" CS (or DTACK?) from the MMU which might be overdriven by 16MHz accesses ... so you'd have to buffer and shorten it with monoflops or sth.)

some SCSI-adapter shall be to slow on byte-accesses on 16MHz

> * Both circuits also switch the CPU to 8MHz while BG (bus grant) is active.
> The last item I DO NOT UNDERSTAND! Documentation for the MC68000 says that

doesn't makes to me any sense either as i think to remember the ST won't use it anyways - perhaps for DMA ?

it's just a way of easyly being sure CPU works on internal opcodes i believe. or, no i think it was used to determine the right clock phase to toggle 8/16MHz without danger of crashing CPU - i should look it up agin at home ...

> Any comments / experience on this?

i stopped working on the 16Mhz improvement just on lack of dicipline and sparetime, but i'm quite intrested to get more out of the thing besides speedy DIVs and MULs (:

> Switch CPU to 8MHz IF
>   there is a bus access (AS active)
> AND NOT
>   bus-granted OR rom-select OR fpu-select

hm, should think this over - did all this last year, you know - tend to back up "elderly data" deep into my brains (=

feel free to get in touch if you like to evolve this ...

Hi,

I've got a CD-Rom with the "famous" Joliet system for Zin95. I tried to read it with Spin, both in Magic and Multitos, but I can see only this small file:

This disc is in the Microsoft Joliet format, with long filenames in Unicode.
It requires Microsoft Windows 95 or Windows NT to be accessed.

Could it be a multi-session disc with a "normal" iso9660 session and a Joliet one ?

Any idea ?

Bye,
/Pascal/

Try a forced mediachange (shift+ESC in many desktops), this will tell SPIN to
cycle
through sessions.

"Many" ? This doesn't work with mine (MagxDesk). So I used forcemed.app
instead. It switched from the small file to a (huge) track001.dat,
that's all. No files appeared :-(

Bye,
/Pascal/

You can register onto Connect Free http://www.connectfree.net/ or find
someone who owns a PC can register you on Freeserve.

Quite frankly the CDAR is so rare that you're going to be better off getting the cheapest slowest SCSI CDROM you can lay your hands ona nd marrying it to an ACSI-SCSI converter of your choice and using Metados 2.74 to access it....You might even be able to use part of the CDAR unit as a host case, possibly even there's an ACSI-SCSI converter in there too (don't think so though)...

It's not for me, I use Demon and can use both ST & pc. It's that I've

tried Connect Free and another with the ST & STinG and they are still
using CHAP:(

I'm still getting enquires from ST owners whom are suprised that it's
possible to get on the net with an ST. So I wanted to find some FREE IPS
to get them going.

Freeserve are accessible with an ATARI,and are no slower than Demon.

There are about 25 free ISP's now,and not all of them use CHAP. So it must be possible to save some of these people some money.

I have the following ST equipment for sale:

2 x Atari 520 ST Power Supply $20.00 Each
Atari SF FDD Power Supply $10.00

Atari SF354 SD 3.5" FDD
Drive with P/S and Cable $20.00

2 x Atari ST to SCSI Host Adapters $25.00 Each
Supra ST SCSI Host Adapter $35.00
(this is the one w/o the clock)

Astra ST HD Host Adapter $35.00
This is still in the box that it came it. The power supply is shot,
but if you want to put a small power supply in, you have a ready-built
HD system for your ST. Just add HD.

Magic Sac w/Translator One Box / All Cables / Cart w/ Mac Roms
w/Disks. I don't know if it works, but it used to.
$40.00

Z-Time Chip (Real Time Clock) with Software $15.00

QMI Desk Cart $10.00

2 x 40 MB SCSI 5.25" Half-Height Hard Drive $30.00 Each

All prices are "plus shipping."
All items are in Durham, NC USA

Hi Steve
Try this webpage for all you need to connect your ST to a free ISP.

http://www.users.zetnet.co.uk/rgoring/support/

Cheers
John

>Martin

If it is just booting you are after then you do not need
any software on disk to get a 520ST to boot
as all this code is located in TOS (PROM) unlees it is a
very old ST without the TOS in PROM.
Just have a blank 720 disk in the drive and start the computer.

I suggest going to Halvard Tangeraas' site and downloading the info file
which describes this very project.

I don't have a URL to hand but you should be able to find it easily enough.

I'd be inclined to write a script for Connect to do this - why reinvent the wheel?

Seriously, I'd be interested to read how you progress with this, what's the
price for the camera?

And the same question's always asked in return - what programs do you want
drivers for?

I can reveal however that most if not all LaserJet drivers will work with
that printer.

> > Any help would be appreciated.

As you say, it's really a museum piece. It was one of the first (if not
THE first) CD-ROM drives ever built, so I doubt the drive mechanism
would be compatible with any new or old existing drive. What is actually

wrong with it ? If it's a power supply problem (like it just won't switch on), then maybe any elctronics repair shop could fix it (for A LOT of money). If it's anything else, you might as well sell it to a museum, I'm afraid. Seriously, if Best Electronics couldn't help, and neither could anybody help, then I'd say it's probably time to call it quits.

Nick

Yes, it's another F030 clockpatch problem...
After years of hesitation I finally decided to put one into my Falcon.
I bought a 74F04, spent about half an hour opening up my Falcon
in an attempt to reach the U63 GAL chip, followed the instructions in the
CBHD manual, got everything in place, turned on my computer and...
nothing happened.
So I removed the 74F04, tried again and the computer worked fine.
I put the 74F04 back in and doublechecked all the solder connections,
but the computer still wouldn't work (no screen display, no disk activity,
I suspect no CPU clock :)
Anyway, what could I have done wrong?
Did I use the wrong type of clockpatch?
Did I buy the wrong type of 74F04?
Could I have damaged the 74F04 while soldering?
(well, of course I _could_ have, although I took some care not to
let it heat up too much or destroy it with static electricity...)
There is very little information available on use of the
clockpatches (which one to use in what case, etc.)
Can anyone shed some light on my problem?
Wiring of the patch and IC and motherboard details are stated below.
Thanks,

-=Levien

A Mega ST uses chips, not SIMMs.

> 4) Can I leave the old mem in the ST 2 and simply put in additional
>   mem-chips?

Nope, you need an upgrade board. You will still have the satisfaction of soldering a few wires yourself, but it's nowhere near as complicated as soldering each chip one by one. The bad thing is that you will probably have to bypass the onboard RAM.

Cher ami(e)s Ataristes,

Depuis maintenant 2 ans nous travaillons sur un projet de creer un "Kit de developpement pour Jaguar" pour Falcon Atari.

Celui-ci etant aujourd'hui tres avance, les logiciels sont globalement
operationnels et une nouvelle carte avec des capacites tres avancees
est en cours de finalisation de conception. Nous vous invitons a venir
visiter notre site pour decouvrir un peu plus le-dit projet.

Si notre projet ne vous interesse pas, veuillez nous l'informer afin
que nous vous effacons de notre mailing-list.

Vos reactions nous interressent, contactez nous.

L'equipe Jaguar,
Laurent et Sebastien FAVARD: atari@linux.utc.fr

Dears friends Ataristes,

Since 2 years now, we work to make a "Jaguar Development Kit"
for Atari Falcon.

This one is now very advanced, softwares are ready and a board with
large capabilities is being in final design. We encouraged you to visit
our dedicated Web pages to discover a little more about this project.

If our project doesn't interest you, please contact us to remove your
email from this mailing-list.

Your reactions interrest us, contact us.

Jaguar Team

I have mentioned harddisk. Found jumpers for SCSI-ID. OK.
But there is more as follows:
0 0 SS
0 0 TE
0 0
0 0 EP
0 0 WS
then
0 0 A0
0 0 A1
0 0 A2

I suppose:
TE could be Terminator Enabled
EP Enable parity

But the others?
can anyone help me?

Hi there!

How do I get my Mega STE to work with a Compaq C2244 HD?

It is a 550 MB SCSI drive, and although the computer does recognize it as being a Compaq C2244, it is impossible to partition it, let alone format it or even zero the damn thing.

Do I need a special program to work with such a drive? If yes, where can I get it?

Thanks!

Michiel

A0, A1 and A2 are the SCSI ID jumpers, it's binary code from 0-7. Do not

use 7, some softs want it for the machine. Don't use 6 for the same reason
until you know which ID the driver uses. 0 is normally the boot drive, then
fill your hard drives from 0 upwards and removeables like CDROM's and tapes
from 5 downwards...

WS have anything to do with motor spin up or some else, not needed on any atari. Use the default setting, in think it's OFF

As ID-Jumper you found 3 Jumpers on any SCSI Device
A simple combination of these jumpers gave a static SCSI adress beetween 0-7 to any SCSI device.

Jumper No Counter

Jumper 0 = 1
Jumper 1 = 2
Jumper 2 = 3

We can switch Adresses beetween 0 and 7

Example : Jumper 1 = ON and Jumper 2 = ON results: 2+3 = SCSI ID5
Example : Jumper 0 = ON results: 1, all other are OFF = SCSI ID1

Some external SCSI Devices have DIP switches outside..
so you can use any adress beetween 0 and 7 simple by use the DIP switch backside of SCSI case.

Part out of DOIT-Archives

Regards, Robert

Normaly this clock patch works perfectly. Mean that the machine
must run, SCSI transfer is another story.

How do you get this bullshit???

A normaly standard DIL chip with the case sign left hand case
have that pin out:

```
      14       9   8
>      |   |   |   |
>    ,-+-+-+-+-+-+-+-,
>    |   |   |   |   |

>    '-+-+-+-+-+-+-+-'
>      | 2 3 4     |
>      1           7
```

Kick people they gave the wrong pin out to you, thank god your
falcon lives.

Take DOITArchives (DOITF030) for colorised ClockPatch pictures...

I guess that you have a ACSI -> SCSI adapter (like e.g. ICD AdSCSI ST)
and all set up properly (SCSI Termination...).

I once had the same problem with ICD AdSCSI ST and a 426MB SEAGATE ST1480N.

The error was:
I had set one jumper of my ST1480N in the wrong way so that the disc
didn't spin up.
The controller was working therefore it recognized, that it was a
SUN0424-something HD (it was previously a builtin HD of a SUN...).

If you don't know, which jumper:
try to get a spec of your HD.

I got the spec of my SEAGATE ST1480N at

http://www.seagate.com:80/support/disc/specs/st1480n.shtml

I just had to change
J6-2 Motor Start
and it all worked like a greased pig in an accelerator ;)

hello .

----

ive heard that you are surching for the jumper settings of your quantum prodrive LPS 525S .

I HAVE FOUND A REAL GOOD SITE ON THE NET WITH ALL KIND OF HARDDRIVE JUMPERS SETS ,ALSO FOR SOME OLD TYPE'S WHO DONT EXIST ANY MORE.

http://www.blue-planet.com

MANY GREEETINGS TO ALL ATARI FRIENDS OF THE WORLD

EEN zeer NUTTIGE site voor UW NEDERLANDSE ATARI CLUB (keep going on).

met vriendelijke groeten van danny busse
(atari club genk belgie)

OK, guys

HELP!

I've a falcon with an actionsoft 72pin simm adaptor in it, and I also have an atari-wing 30pin simm adaptor.

Currently the actionsoft board is populated with one 72pin 8chip toshiba germany simm. I don't know how to read off what the details are.

Problem is: I want to upgrade to 14(16) megs, and have tried EVERYTHING! 72pinners, 30pinners, edo, standard, parity, non-parity.

Question: how do I upgrade (without spending 60quid on a custom board)? What does the falcon need? 60ns? 70? etc. etc.

All and any help appretiated.

yours etc. [aibs.pem.cam.ac.uk]

Go to http://www.calamus.net and follow the "Downloads" link - all the drivers presently available (aside from commercial ones such as the GDOS driver from Adequate Systems) are there for the taking.

I am a Newbie to this group and I'm not sure that this is a relevant
enquity but any help would be appreciated.

Ihave three Atari ST's, an STf and two Megas, all expanded to 4 Meg and
TOS 2.06. The floppy drive on one of the Megas has just expired and I am
looking for a replacement. I am pretty sure it is the drive itself that
is at fault as swopping the drive from my STF in to the Mega produces
normal operation.
Unfortunately the drives in the other Mega and the STF are not the same
shape as the one that expired.
The expired drive was made by Sony, it says LG-36 on the circuit board,
and has C 103164 and CA200323 embossed on the bottom cover.
It has a small rhomboid eject button on the right and the activity LED
on the left, as opposed to the others which have a central wide eject
button and the LED on the right.
I would like to replace the drive with something that can handle 1.44 Mb
formats, and hence read discs formatted on a PC. Under TOS 2.06 all the
machines are able to read PC discs so long as they are formatted at
720 kb.
My questions are;

Would it be possible to replace the drive with one that does not require
substantial modification to the casing ?

Would it be possible to replace it with a drive that could read and
write to discs formatted to 1.44 Mb without extensive modifications to
the circuit board ?

Failing this, could a second external floppy drive be used to read 1.44
Mb discs ?

I would be grateful for any advice and suggestions on the sources of
parts in the UK.

Many thanks
--
Steve Coates

Well, maybe some handovers from the 500-series DESKJETS! Or my Star LC-10.. sob, why did it have to die? :)
Such as:

* An online button (useful for stopping the thing in emergencies, especially as windows stop is often useless, what with the 870's HEEEEUGE buffer!)

* And joining it as an optional extra, a reset button. (870 takes an age to power-off and on again)

* Replace soft-off switch with a proper, means-business click switch.

And some things more suited to plain-text printing. Your average printer still gets used a lot for this, although nowadays most PC people use the godawful Notepad to print stuff through, which uses the real printer drivers. But of course, on the ST you won't always have access to such stuff. Although if you're shelling out for a big printer like that, a few more pounds for a desk accessory printer thing isn't too bad I guess..

* A Draft/Full quality button, for when printing plain text files (I find DOS edit far more palatable for this than notepad or any windows app). Or for use with the atari, when you want a quick copy and your program has only very basic functionality (or printing from the

desktop).

* A text-compression button. For making your words smaller. More letters per line = faster print, longer lines (very useful for spreadsheets and the like), less ink used, space to write notes. With the old Star printer, you could halve the space needed, so you could get two pages per real page! Very useful. I'm hating this 870 for being so.. bloody.. unswervingly.. WINDOWS-ONLY!! :)

* Oh, and a line-feed button. One for both directions if you can. Can't remember what THAT was useful for.. :-D .. but it'll come to me soon.

* Maybe a key combination to select a text font (remember ever doing that?) or even better a colour for your plain text. That was cool.

The 500 crammed all of this except colour buttons into 8 separate controls that would fit in between the two overly chunky buttons on the overly chunky 870 (much of it is empty space). The aforementioned Star LC-10 managed with only five, and didn't require any dip switches. Aha! That's what else is missing!!! (etc etc etc)

Basically, we just don't have the control we used to, outside of windoze anyhow. That frightens me a little.

>
> I guess anything else you might need would be in their Windows
> software.

Yeah, but.... :)
Many many net things are just TXT files. You try whacking one of them through Notepad print, and then later through DOS (or DOS Edit) print and see just how much slickness has been lost over the years. Sure, the windows controls are the epitome of fast, effective control when I need full-colour photographic output for an A-level project (although for some damn reason, for the past three years, it has INSISTED on resetting to "landscape" paper size every print time.. have to keep changing it). But of course, isn't this an Atari ST newsgroup? And have you ever tried printing the complete solution to Final Fantasy Six through notepad? My brother has. It's not a pretty sight. I wheeled out the old 500, draft mode condensed size printed it from dos, produced something much more legible (no more
split
lines, especially not in the mid
dle of a word) in half the time using much less paper, and got thanked grudgingly for it as he could now read the damn thing. Ahh...

Hi

Just a simple request, and that is how trustworthy is Bravo Sierra
Computers.

I'm curious as I've no idea on a person when doing a mutual swap, is not
prepared to mail goods at the same time and with no clue to his
whereabouts in the world.

Thanx

The motherboard is Rev. D C070789-001

The current RAM chips are directly under the PSU daughterboard on the main motherboard and theres space for another 512k of memory but I was hoping to go beyond this.

I don't mind doing a lot of soldering and mucking about and I do have some old PCBs to raid for components. I also have a few old 256k simms and possibly a 4MEG 72pin type too.

I corresponded with one friend in Hawaii who dealt with him. Said he was
a great guy to deal with, and received lots of freebies with his order.
I believe he said he was in Oregon. Used to be active on the newsgroup
promoting his used atari catalog lists.

:Though how to change it I don't know....

You're talking about TOS 4.xx, which comtains several
languages and even more keyboard versions.

Hi Folks....

We've been sent these flyers at work for what seems to be a very cheap digital camera. It is 640x480 and it uses a flash card (1Mb or 2Mb) to give between 10 (Fine quality on 1Mb) and 40 (standard quality in 2Mb) pictures.

I phoned their technical guys and they reckoned that the camera uses .JPG compression on-board, and also that the serial port it used was 115K2 maximum. They couldn't give the the negociation strings because they didn't write the software, but as one of them could confirm that it took less than two minutes to do a complete dump of a 1Mb card into his own machine I think it is likely that there is very little in the way of negociation to do. It is probably no more than a <How many pictures do you have>, <X>, <Send me picture n of X> <N.jpg transmits.....> kind of routine. It certainly isn't acknowledging every bit,. and I can't see that it is using packet streams either.

If I can find out the strings involved could someone hold my hand while I try and code a .TTP that will do nothing more complicated than dump the contents odf the camera into the folder that contains the .TTP, that is the bare minimum that it needs to do. Extras like creating a new folder for each download would be nice.....but not neccessary in version 0.01......

ASP will be doing a 4Mb upgrade board soon. Predicted price of a board without SIMM's is going to be about 25 quid inc postage etc, you'll need four 1Mb SIMM's, preferably identical. Fully fitted and loaded with 4Mb of memory it will be about 45 quid. I'm still sorting it out, I want to keep the price as low as possible which means it might be a bit fiddly to fit, but it'll be cheap./...

Hello,

I'm looking for a power cable for the SX212 Atari Modem. Does anyone have one
they
want to get rid of or know where I can get one?

Thanks!

Darren

S�lir allir (hi all), hafing read the post on this discusion group
for a month or so I dear put up a queststion on a mater consurning My
Atari Mega Ste.
Where as the Atari Mega ste and the Atari TT are so similar, is there
a way to turn the Mega ste into a TT in a grand and simple
way? By for instenc simply put in a motorola 68030 chip in sted
of the 68000 one. I am aming at Linux. Is there a Wissard on this
schine who could/would point me in the right direction for
information,
suply of parts, or enithing else consurning my questtion.?

Here in Iceland, the Atari has no suport, but several machines are
still in use.

You can anwaly develop your own card :-)

There was one other solution I know of, which was Martin Wevelsiep's ST-RAM
extension. However, this required quite extensive soldering (he would only
sell it when he did the modifications, and for good reason), and it was much
more expensive than the Magnum. I am not sure if he still has cards left,
you might reach him at Martin.Wevelsiep@post.rwth-aachen.de

These machines are not similar at all, except for the case, so no, there is
no such way.

Hi!

I have a SCSI to ethernet adaptor that have been used with a Mac before, does anyone know if there are any kind of drivers for such a thing?

Another thing, there are some RS-232 to ethernet adaptors aviable, wouldn't it be possible to use one of those to interface a Tos machine to an ethernet?

Regards..

Helpfully one of the guys at work has actually bought one, so would
<sniffing> the serial port be possible?
BTW the camera also works at a download speed of 19K2......

In both cases, we need technical documentation for programing drivers (eg. for STinG) so is the reason why we must choice a card available in every contries.

Cheers,
Olivier.

hi all,

Has anyone heard of a AROWANA fm56vt modem?

It has been flashed for V.90 but it keeps trying to connect via x2.Is there any way I could disable x2 so I can use v.90?

As you can see I got the Freeserve bit working (thanks to those who
also emailed me)..I joined Cable & Wireless online via the PC (Piece
Of C*** {cake}), the nice thing about Cable & Wireless Lite is that
it is free bar the connection fee of �10 but there is the added bonus
of having your phone cost cut by 25% if your have C&W phone service,

which is already cheaper than BT overall.

Cheers

Yoy have to change your init string after upgrade. I quess that you
have +ms=56, ... somewhere in your init string. Replace that "56"
with "12" witch stads for v.90 mode. If your ISP supports v.90 mode,

you should hear totally new "negotiating sounds" ...

```

Hello,

I've got a Mega ST 2 and want to upgrade it to 4MB
(should be enough for the time being).

While reading in DejaNews (http://www.dejanews.com/home_ps.shtml)
I've got some information, that ST 2 doesn't use SIMMs
(although one of the FAQ pages says, that
"your ST is equipped with SIMM memory",
"30pin SIMMs" with better than
120ns for the 1Mb SIMMS would be ok).

It's a bit confusing.

30pin-SIMMs, 1Mb, 60ns
or
DIMMs?

1) Are there some addresses (WWW?) to order the appropriate memory chips?

2)Is it a nightmare to upgrade? (with medium soldering ability which means
I did a few boards although not computer-boards

-and yes- I know, that I have to pay attention to static electricity and
the 50Hz netfreq. in Austria...)

3) Is there some page about what else I have to do (resistors?...)
in the Mega ST 2?

4) Can I leave the old mem in the ST 2 and simply put in additional
mem-chips?

Thanks in advance
ME

Sounds like a nice bit of kit however I'm only looking to do
a DIY project. I have a 4MEG STe and Falcon already but just
fancied having a go at upgrading this STFM myself right down
at chip level to 4MEG as a sort o educational electronic
experience learning as I go in the knowledge that if I
completely ruin the STFM in the attempt I won't be too
bothered about it. Theres no point me spending any serious
money as I'll probably ruin it later on with something else.
However I am hoping to upgrade the FM to 4MEG, 16MHZ and a

high density floppy drive (it doesn't have a floppy at all
at the moment). At the moment I'm just collecting as much
info as possible on these various hacks.

Has anyone done the 4MEG 72pn simm to 1040STFM modification?

Some Mega 2 were deliberately made "brain-dead" by Atari and cannot be
upgraded unless you do a board upgrade or a do-it-yourself hardwire
project, some of which can be found in the net. Other Mega 2 units were
Mega 4 with the empty portions of the motherboard ready to populate with
the missing chips, capacitors and resistors to make it a Mega 4.

[...]

Thanks for your effort.

Is there any information which Mega ST 2 boards are "brain-dead"
(like a list of serial numbers of boards or similar)?

And if I find out that my Mega ST 2 is not "brain-dead":
Do you have any pointers to the WWW-pages that you mentioned(URLs?)?
I tried to find some with AltaVista and other searchmachines but everything
I got up to now is inaccurate and/or partly contradicting information
(e.g. SIMMs or not SIMMs...).

I would need some exact information:
-which resistors (which ohm-values) and where to put them on the board?
-which mem-chips are known to work fine
-capacitors: which (nFarad)values? where to put them on the board?
-companies that sell the above?

Are there any "maps" of boards which show an update for a Mega ST 2 -> 4MB?

I would even volunteer to make an exact WWW-page with all the accurate
information if my 2MB->4MB project succeeds because imho the information
that is available now is rather "flummoxing" :)

there is too much hype on the y2k thing and a lot of false
information. The bible versions we have today are perhaps more
accurate then in King James day due to recent manuscript evidence.
I know this is an Atari newsgrp, but I HAD to say something!
(I use the atari concordance program...great app!!)

Hi ,

Wondering if anyone can help me with a bit of a bug in the system.

When I type a sentance on any WP program , or text editor , the text frequently 'pauses' before being printed on the display.
I'm not sure what is causing this time drag , but I have recently reinstalled NVDI v3.01 with more fonts than I had previously would this have some affect?

The time drag is also noticable when scrolling pages , and other functions.

My system is a 4meg STe with Ease and Magix v2.01

Any suggestions?

Cheers

Paull

 hi, is there anyone who can help me with aproblem i am having with
 my new jam box and cubase audio.
 i do not seem to be able to get sound out across all eight channels
  only the first two.I have followed the manual to the letter and
  made all the right moves in the midi mixer(i also have audiotracker
  which i have got up and running so i know the unit is fine)
          cheers for any help Paul.

I agree for certain, like Steve, I have bought stuff from a long way away (importing Mario's stuff must be almost the longest possible journey to make on this planet for bits I guess :-))....It's always helpful if you put the area or coiuntry in the mail, preferably the Subject header....I'd be happy to pay shipping on a Transputer from just about anywhere, but if a CDROm drive is for sale in the states then there's no point me reading the message......

Hi Folks, this one will get cross-posted to CSAS so please don't moan about it....it is deliberate :-))

I've been testing Mario Becroft's internal IDE interface with the following system...

TOS2.06 (on the interface) STFM plus an ICD Link2 external ACSI-SCSI host, with a Conner CP2061 60Mb 2.5" IDE hard-disk, a Matsushita 6x SCSI CDROM and an IBM WDS3158 120Mb SCSI hard-disk.
The software used was AHDI 6.06 and Metados 2.74 from the Stratos 4 CDROM.

Also the freeware (I believe) CDPLAY audio CD player programm was tested
with the system...

In short, the system ran fine. The internally fitted Conner drive is being
picked up as C:, the IBM as D,E and F, adn the Matsushita (Panasonic) CDROM
is recognised perfectly by Metados. CDPLAY picked up the drive happily, and
despite the german interface I was able to get it to play, pause, stop and
eject without problem. It won't close the drive with the eject button
though....

chrisc
I am now looking to test the system with an IDE (ATAPI) CDROM. DOes anyone
in the UK have such an item I can borrow for testing purposes.....I'll need
it for no more than a few days, and I have a good name to protect so I'm
unlikely to rip you off for a CDROM.......

I have now written two tiny tools that will convert between Latin1 and
Atari charsets, they will be uploaded to my website and ftp.funet.fi
as soon as I've tested them a bit more.

The Deskjet software package you are looking for is 'The Deskjet Utilities Pak', Authered by Scott Saunders. I have the original pamphlete (manual) but the original disk was sent back to the author for a upgrade which was never finished. I do however have a backup disk from the original along with the registration number. I have no use for this anymore and will gladly send all I have along with the regitration number to you if you want. I'll try to see if all on the disk is still good. I have read the docs just now so know that those were good.

You can relpy by e-mail with your snail mail address, name etc.

Maybe an excuse, but certainly not a valid reason IMO.

Remember software companies saying that software was expensive because of
piracy ? Did you see the price of software drop when everyone switched to
the CD-Rom media, before the arrival of CD-writers ?

>Was the priacy that went on back then
>worse for the Atari then for other platforms (I've often wondered about
>this)?

I don't think so. The difference was more in the price of software, and
companies going where tha money was.

> Of course the rise of Windows and the mismanagement of Atari were
>probably the most important factors in its demise.

Definitely.

Nicholas

I'm no lawyer, folks, but I find these comments interesting.
How do we regard a computer author, who simply disappears from view,
refusing to acknowledge any connection with his program or
refusing to reply to requests...?  Or another who simply disappears
from view, with no trace of his existence?
```

I refer to the author of FZT (Freeze Dried Terminal), who seems to
have gone to Pluto, and the author (W0RLI, still active) of an Amateur
Radio Packet Program. Both have abandoned the Atari platform without
so much as a By-your-leave and still ignore their previous clients.

What rights do they have?

Does the Colour.cpx not have an Invert option (instead of the colours
Bank Scroll option) as the manual (p 6-12) says for `ST' High?
Mind you, I don't know if the cpx applies to TT High -- lucky you :)

Charles.

Anyone got any handy info on lightguns.

I fancy converting an old spectrum model I have for use with the ST for a game of space gun if nothing else.

Of the two lightguns I have, one a sinclair and the other a Cheetah it looks like theirs at least four connections which I guess are;

Earth/ground
fire button
power 5V
light gun signal.

On the Cheetah lightgun which is meant for Spectrum plus2/3 models these signals are mapped onto the normal movement directions of the joystick port. i.e. left might be the fire buttion, right might be used to power it and down might be the lightgun signal itself.

What I want to do is make an adaptor to convert the cheetah lightgun plug into the ST wiriing configuration and so need to know how the ST lightgun that used to be available is connected pin wise.

I also want to make a cheetah to STe joystick port adaptor to so I can use the lightgun with stos based games to.

the cpx does nothing that's why i ask.

linux68k can invert the video so why can't any cpx ??

Hi

If there's something like this about for the ST's, I'd like to hear
about it as well. I like odd bits and pieces;)

I was wondering if someone could give me or point me in the direction of technical information regarding the Falcon Expansion Connector. I have the Atari Falcon Service Guide which gives me the pinouts of the connector, but I'd like some additional information so that I can confidently design hardware for the system. Is there any documentation available electronically or in print which describes how to properly interface hardware to this connector? Specifically I need "details" on the operation of the following pins: Bus Grant Acknowledge, Combel Bus

Grant Acknowledge, Bus Request, Expand, MFP Interrupt Enable In,
Expansion Bus Grant, External CPU Bus Grant, MFP Interrupt. General
information about what is expected of external hardware would also be
helpful.

Thank you,
Kort Eckman

If you can check again, you will note that I said that the 5v line was
over 6v and the 12v line over 14v even with the full TT load being
drawn.

Cheers

Not Many!!!

Efnet is similar to IRC, but different.

Try #atari or #atariscne

There are a few more that Atarians use on IRCnet. I found the Efnet isn't a busy as IRCnet.

Hello,

The CENTurbo II rev B will come, an update of the software package is done:

CBOOT 1.1.0
CENTvidel 3.2.4
VIDEOMOD 1.2.2
CENTscreen 3.4.6
FLASH.BIN 1.2.6
Cecile demo 1.95

The new version correct some few bugs and bring a lot of new functionnality notably in CENTscreen. The last development of Dolmen make this soft to evolve...

For the Phenix, a modification of the bloc diagram was achieved.

Typical newbie behavior. I regularly send personal emails to people who don't realise that COM, NET and ORG domains exist _anywhere_ within this planet and mindlessly post a message along the lines of:

"Selling my ST with monitor. Best offer gets it. You pay for shipping."

Needless to say, such an ad cannot be accepted. Then again, people who join the net are never told about the basics of netiquette, which would prevent this......

Hi Kort,

I have a VME-Bus Adaptor which comes with a detailed manual. If you
are interested, i'll scan the appropriate datasheet for you. Because
of size it will be the best to send it as PM.

Please answer per PM if you are interested.

Jochen Fietz

Looks like a bus problem / trouble.
Mostly after loss termination or some else.

>I switched off the Hades for a few minutes and initially everthing was

Machine is not relevant, normaly. All the SCSI / IDE schematic on any
machine / controller are the same. Test your hole SCSI Bus with another
SCSI machine, all devices must spin up and they all must shown the
ID and the device type while boot up.

If not, if any device shows badly, remove it.

If you see not one device correct, check wireing, termination first.

>just fine after a new start but alas not for long. Unfortunately I
>only noticed this when I tried to access the Zip. I just couldn't
>but instead of anempty window I got a message box on screen now
>saying: "Geneller Ger�tefehler"

With a ZIP in line, remove this first!
(Maybee a good device to create errors) :/

That's not a -must-, only a idea. (Same as with some syquest devices..)

Check this all first! -Before- you try to write something to ANY device.
(Data will lost, if your system doasn't work well!)

>Whatever buttom I tried I couldn't get rid of that box. So the only
>possibility was a reboot.

Yes, looks like strong bus trouble.

>I tried to boot from floppy. The HDdriver saw the IDE and SCSI devices
>but it also returned me a very nasty message: " No partitions found"
>The day after the problem was even worser. No SCSI-devices anymore but

>noticed that this cable was connected like this:

Check you machine, SCSI-Bus, with a simple old SCSI harddrive.
Best way. If you got no response, can't transfer no data, SCSI Host
looks defective..

```
>
>|4|-------|1|------|2|

>2) Zip drive ID=0
>3) CD-ROM ID=1
>4) External SCSI 2 connector terminated by means of a active
>   terminator.

SCSI Busses in "T"- Form doasn't exist, normaly..

SCSI normaly looks like this:

[1] Host, terminated

[1]------[2]---[3]---[4] <- last device terminated

No "T"-junktions, no double terminators, no other sh**.

>I wonder if this can be the culprit of my troubles. For me it seems
>not the right way to make a SCSI-chain.
>As there were so to speak no partitions I couldn't write a HDdriver on
>the IDE. HDdriver do see the IDE but......

IDE and SCSI normaly are different systems, your machine works correct with IDE
only?
(Remove all other) I doasn't have an hades.

>What is the problem here. IDE down or a major problem with the Hades?
>If it is a HD problem I wonder if I can restore the HD without loose
>of data. My last backup date from a month ago:-((

Hm, badly.. BackUp is the best what you can do, any week..

I'm not sure i understand you correct in all parts, hope my idea helps
Regards, Robert

If it does not exist, let's make it, by patching a german or english one,
with the help of that TOSPATCH utility.

Maybe the fellow from Moscow who asqued questions about his floppy drive
could help with some essential data, such as:

* has somebody over there already done this;
* standard russian computer-keyboard layout;
* standard mapping of russian cyrillic characters into ASCII set;
* standard russian translation of computer-jargon terms appearing in
  desktop menus and dialogs;

I admit that I know very little Russian, but my wife knows it better,
and as cyrillic is my 'native' script we would be able to translate
TOS resource files.

What I am not sure about is actual idea behind it: why would it be
necessary at all? It is highly unlikely that russian Atari keyboard or
keycaps exist. Mapping of latin keyboard to cyrillic characters would not be
very comfortable to user. And it would be quite confusing to have
russian/cyrillic desktop while almost all other software is in english
or german.

Another possible problem is that there are a couple of relatively wide
letters, looking almost like ligatures, in russian alphabet, so they
would be hard to fit, without making them look very ugly, into monospaced
system fonts on Atari- especially in smaller sizes.

cu.

:no but i've got a lot of polish utils that look like the replace the
:characters on the desk { got them with a systen i bought}
:Kevin

Thanks, but it's not the same thing.
Russian is written with the cyrillic alphabet,
while Polish with the latin, although with some
specific national character additions.

Still searching...

This might be a little bit off-topic, but my Portfolio screen went blank and it seems to be a matter of cleaning the connector inside the display. But how do I take the display piece apart? I've opened the edges but I think brute force bending will just killl it.

Does there exist a Portfolio FAQ anywehere?

1) Good ol Gregor didn't say anything about Copyrighted software.

2) Just because something is copyrighted doesn't mean you can't upload
it.

3) "Copyright" doesn't necessarily mean "commercial".

Give the guy a break. He's trying to help the Atari community. At
first glance, it appears that the software in question is PD.

Go to my Website and from there you can download STing dial.scr and
default.cfg files that will connect to you to Freeserve.You will need
to edit the dial.scr but that is easy as I have also told you in the
script where to put your details.

Anyway check out my Website.....address in sig.

Get hold of all the DIY information you can get regarding Falcons (like the DOITF030 archives) and see if there's any suggestions ... I think the 040 isn't pin-layout compatible nor has it exactly the same instruction set.

If you think of doing any experiments contact me as I'm intrested in something similar too.

I have an internal 2.1Gbyte HD in my Falcon, HDriver formated to 20 partitions, only C-P being recognised by TOS (R is my CD-ROM). The rest are recognised and usable by Magic. Is there any way of extending TOS to above the 14 device limit. Magic refuses to recognise R as anything other than a normal 103Meg partition, so do I need to assign CD-ROM to Z or something , ie higher than the real devices Magic sees? Is there any way of expanding say N, O and P to take up the unseen disc space without reformatting?

Still for sale: flat bed A4, B/W scanner/copier 200dpi, 16 dithered gray scales, scans straight into Calamus and Megapaint, printer port.

Yes, you can use BigDOS or MiNT.

Well I finally found out how to take it apart ... thanks to elios at
#atari. You just bend up the plastic surface that is glued to the
front of the panel (just the bottom corners) and there are two viscous
little screws there.
A little disappointment is that the lead seems to be soldered
directly to the board so there's no connector there at all ... so lack
of contact is an even bigger problem than I thought at first, it's
tiny little solderings all over.

I suggest to assign the CD-ROM drive another ID. Z: is quite often used
here. Generally speaking there are three ways to get more than 14 hard
disk partitions: Big-DOS, FreeMiNT or MagiC.

Make a backup copy of your present dial.scr, and then use the "Configs"
section in the dialer to write yourself a new script. The server addresses
go into the "Network Environment" section, you might need to go back over
this section with a text editor afterwards as this bit seems bugged.

Save this script and rename it as required. Then you can click on the top
line of the "Configs" menu and select this or the previous script as
required. The dialer will always pick up a file called "dial.scr" as a
default, so make this reflect your main ISP.

Did you have to log in to Cable & Wireless to get your account started or
did they send you the required details through the post?

I'm thinking about the issue with Freeserve where you have to use a secure
browser to get an account started.

Re-partition it down to a sensible five or so partitions, keep the first
one down to about 20 megs or so for boot stuff, split the rest evenly four
or five ways.....NEVER accept the default splits offered by any HD
formatter, they all seem to assume you want top keep the partition size
down, it's opintelss to have small partitions on a big drive, the wastage
due to sector size is unimportant....

I always use the fibonacci series. Always a partition big enough,
otherwise need a bigger HD.

Cheers
Henk

Hi

I posted this same Q on comp.sys.atari.

The answer I got was that TT high is a different mode then the other VGA resolutions and that it was not possable..at least using color.cpx which only adjusts VGA modes.

HOWEVER..I found a quasi way around it for some applications.
Some programs allow you to adjust the screen colors, such as CAB, so I can invert THOSE colors and whalah..it looks like inverse video.
7UP (the text editor) also allows you to reverse the colors. So it depends on if the application has that function.

Just a thought.

Tim

It's probably the ribbon that is cut somewhere between the mainboard and the screenboard.

You just have to get rid of it and sold wires between the 2 boards. Somewhat difficult since the contacts are very close each other (1/20 inch step), but I did it, and now my Portfolio works fine again.

The screen works if I do not open it all the way, so I think I do not
need to replace it all ... I'll clean it and reconnect with the casing
open so I can check it more troughly. Might as well take a look at
that backlight-project while at it ;)

Anyway, thanks to all of you helping me out!

:The problem is copyright. Although these programs are old, they are also
:still under copyright. You have no right to upload them anywhere. You
:can give away or sell the originals though.

Interesting question this.
What happens with a copyright when the
copyright holder "vanishes"?

If the holder is a deceased company, which is
the normal, it will have no heirs I suppose?

Even if this extinct imaginary company,
without heirs would still be the legal holder
of a certain copyright, what could possibly
happen to someone who breached the copyright?

There would be no one to sue you, no one to
claim rights, no one to compensate.

Seems like a pretty un-riscy business to me?

Interesting, but I'm afraid it has been discussed many, many times.

> If the holder is a deceased company, which is
> the normal, it will have no heirs I suppose?
>

A company can close down, but it's intellectual property, including copyrights, never disappear. Either the company is bought up by another company, or it is liquidated and what's left of it goes to it's creditors (banks or suppliers). In the case of an an individual person, the rights go the person's inheritors.

What I mean is that the copyright always belongs to someone. Whether they care, or even know about it is another question altogether.

> Even if this extinct imaginary company,
> without heirs would still be the legal holder
> of a certain copyright, what could possibly
> happen to someone who breached the copyright?

Of course, the question of "I know it's illegal but nobody cares" is another issue totally. It's up to you to take the risk. Nobody cares if you drive through a red light at midnight if there's no other vehicle around, but if you get caught you can't complain.

>
> There would be no one to sue you, no one to
> claim rights, no one to compensate.

Wrong. The ISDA has started closing down many "emulation" sites, in the name of companies they represent. This organization is funded by software companies to defend their rights. IMHO it's rather silly to go and attack "obsoleteware" sites when there are so many real warez sites around. It's probably just a matter of it being easier to deal with. The thing is, these people have the law on their side, and there's not much we can change to that.

The only way to change this would be to write to software companies and ask them to release their old software into the public domain if they wish to no longer support it. This would be a constructive move for everyone. Some companies have done this already (GFA Basic 2, STOS, 1st Word, plus lots of shareware stuff).

Maybe we should form a group whose goal is to get copyrighted software which is no longer supported into the public domain. It seems that most companies who made software for the Atari have moved on to other platforms and no longer care about the Atari. This would greatly benefit Atari users everywhere and would help keep the Atari world alive. If there were more programs available to me, I'd use my Atari more often. Perhaps this could even spark an improvement in the after-market of Atari computing.

Just an idea. What do you think?

<graiter@SPAMLESSstarmail.com> wrote:

>Interesting question this.
>What happens with a copyright when the
>copyright holder "vanishes"?
~^

Generally when a company goes bankrupt it is swallowed up by other companies for its assets. So the copyrights for the old software could end up in the hands of any number of people.

For example, there was a company called Starpath that made games for the Atari 2600. They fell upon bad times and were swallowed up by Epyx who continued to operate Starpath under their control. Epyx in turn fell upon bad times and was swallowed up by Bridgestone Media, a Christian software company. Bridgestone had no interest in the rights for the old Atari 2600 or any of Epyx old software, they wanted the company for it's machines and personel.

It can be extremely difficult when companies are repeatedly swallowed to track down the copyright holder, especially since very few companies ever register their software copyrights. This is done for security reasons because to register a software copyright you'd have to send a copy of the source code to the Library of Congress (in the states) or... aw crap I can't remember their name in Canada, but it's a similar organization. Then your source code becomes a matter of public record and anyone can look through it. It should be noted that copyright violation cannot be prosecuted in a criminal court unless the copyright has been registered, however, you can still have your ass sued into oblivion in a civil court. But in Canada you can only be sued for real damages, so the company who owns the copyright would have to prove that your copyright violation cost them legitimate sales of the work. If the work is discontinued all they can sue you for is to have you stop.

Anyways, without having the copyright registered it becomes extremely difficult if not impossible to track down the legitimate copyright owner. Many of the companies that own the rights to ancient software don't even realize they own them or care especially if they bought a company that bought a company that bought the original company. The companies are usually purchased for other reasons like I mentioned up above in the Bridgestone example.

I don't know if this exists in the states but here in Canada if you have made an effort to track down the owner of a copyright and have failed you can apply to a government office to aquire permission to use and distribute copies of work, but you actually have to have made a serious attempt to find the copyright holder which means more than calling the number on an old warentee card and discovering that the company has been out of business for 15 years.

As well, there are proposed changes to the copyright act before the lawmakers in Canada right now that will allow for the copying and distribution of copyrighted works that are "no longer commercially available". This ammendment to the copyright act is being done mostly to accomodate Libraries, Archives, and Educational Institutions. Before the law is passed libraries, archives, and schools had to own a legitimate copy of a work to make it available to the public. If the work in question was out of print then the organization was out of luck. When the law is changed it will be possible for such organizations to have copies of these works available when the original is no longer available commercially. What does this mean for computer enthusiasts? Register yourself with the government as a software archive and you can make available to the public discontinued software. Of course there are certain steps that need to be taken in order to be recognized as a legitimate archive.

As far as I know there are no such ammendments before the legislative bodies in the United States so you guys are out of luck. Of course you could always set up a webpage on an ISP in a country like Pakistan, Taiwan, or any other number of countries that do not have copyright laws and archive the software there. Or wait for the ammendments to the law her in Canada and set up an archive on a Canadian ISP.

But as you said, the chances of getting "busted" are slim to none. The worst that will likely happen is that the copyright holder, if they object to the unauthorized use of the software, will issue a "Cease and Desist" order. So then you decided if you want to comply or ignore it at your own risk.

Now as a matter of ethics, some people are very much into "the law is the law is the law". If the law says something is wrong then it is wrong, if the law says something is right then it is right. Personally I don't have any moral or ethical objections to people making available discontinued works. I'm a working musician who pays my mortgage with my royalties so I appreciate the need to protect "intellectual property" rights, but only so far. If a market has been abandoned while there is still a demand for the works then I feel people have the right to satisfy that demand themselves even if this means violating copyright law. When it comes to works I've created which for whatever reasons I no longer choose to make them commercially available I have no objections to people making illegitimate copies of that work and distributing it to others who have a demand for those works. It's not like it is costing me any real money.

One thing people have forgetten is that copyright law was not created to protect the property rights of artists. Copyright law was created to increase public access to created works. Offering limited protection of the artist's "intellectual property" was the means by which this was achieved. The orginal term of copyright protection was 26 years, after this time the work became public domain. This gave the artist a limited monopoly on their work but ensured that the public also gained access to the work. But then something happened that the original copyright law didn't take into account, copyrighted matterials were no longer works of art but became corporate assets. Businesses had more money and more influence over the lawmakers than artists so the terms of copyright protection were extended, and each time it looked like the copyrights were about to expire the businesses pressured the government into extending the term of copyright protection. Now copyright law is "life +50" if the copyright is owned by an individual or 75 years if owned by a business. The various media companies are now pressuring governments to have it extended to an even 100 years of copyright protection. Personally I think it is rediculous that a piece of software should have a copyright that extends beyond the patent of the machine it is written to run on. I think 10 years is more than generous for software copyright given the the commercial lifespan of the average piece of software is around 5 years before it needs to be upgraded as the machine it was running on is obsolete. For other works I'd like to see the term brought down to 26 years offered by the original (and in my opinion the best) copyright law.

The original copyright law was made to encourage people to create works of art so that these works would become available to the general public. It was the public's interest that was being served by the law. Today copyright law grants ever increasing monopolies to business and denies public access to created works. It is the corporate interest that is being served.

It has never been cheaper or easier in all of human history to create or distribute works of art. People no longer need an incentive to create art as they can now afford to create simply for the sake of creation. Unfotunately we are now living in a world that rarely recognizes art and is only interested in "product".

Right now businesses are putting pressures on our legislative bodies to ever tighten their control over their products. They are already striving to create a world where consumers are not only charged money when they buy a product but are charged more money everytime they use it in the form of royalties (there's already a DVD player that does this everytime you watch a movie). You will not be able to listed to a song, watch a movie, or use a computer program without being charged for it. Now it could be that as businesses tighten their fist around their "products" we will see the public interest turn away from commercial products and towards true artists who create simply for the joy of creation. But then again who is to say that businesses simply won't find a way to make self-publishing prohibative if not illegal.

Already here in Canada there is a tax being applied to blank recording media of 50 cents per 15 minutes (this more than doubles the price of blank tapes and CDs) This tax is being applied under the guise of helping combat music piracy. The truth is this tax hurts musicians as they are not exempt from the tax. So when an independent band buys blank cassettes or CDs or DATs to distribute their work they are paying a large tax that the big record labels are exempt from. The government says that musicians will get the money back from SOCAN, but the truth is the only people who will see any serious money from this new tax are the large labels and the mega artists like Celine Dion (which is why the new tax has been dubbed "The Celine Dion Tax" by Canadian musicians). The large record companies have been seeing some serious erosion of their profits by small indepently released albums. Even though an individual independent may not sell a lot of albums the fact that so many artists are now independently releasing their works the number of sales really adds up. This tax was created for one purpose only, so that the large recording labels can get a chunk of the sales of works by independent artists. I predict that unless the public stops blindly accepting that "the law is the law is the law" you're going to see a lot more taxes and sanctions passed that are being pushed through legislation by business to prevent independent artists from publishing their own works.

Wow! What a rant, eh? A discussion of discontinued Atari ST software that ends up with businesses corrupting the laws that were designed to protect the public interest. Only on Usenet.

You'll have to forgive me, but as a musician who makes his living from his art copyright law (especially the perversion of it) is one of my passions.

TT FOR SALE!!!

Atari TT with internal HD (40 Meg.? I think). It comes with the color monitor, PTC1426 and 8 Megs. of RAM (4ST, 4TT) and an external hard drive which I believe is 400 Meg.

With loads of ST and TT software.
I also have a Migraph Hand scanner which can be used with an ST or TT.

All for $450 or Best Offer!!!

I'd like to try to sell locally first - I live in the western suburbs of

Chicago.

~^~

Just because something is illegal it doesn't mean it is morally or ethically
wrong anymore than something that is legal is morally or ethically right.

History has had many unjust laws and there are still unjust laws in the world
today.

None of us here have any doubts as to wether or not distributing copies of obsolete, discontinued software is legal. Besides even taking the position that it is illegal is rather ethnocentric to begin with because this is Usenet, the posters here come from all around the world and the laws in their country may very well make the practice legal. So telling some guy in Pakistan he's wrong for putting up discontinued Atari ST software on his site because it's breaking US copyright law is pointless.

What is at the heart of this argument is "Is it right or is it wrong?" not "Is it legal?". My position is that it is not wrong for a person to distribute software that is discontinued. When copyright holders abandon their market I feel that market is perfectly justified in satisfying their own needs by distributing unauthorized copies of the works in question, wether it is music, film, books, or software.

Heck, I sleep a lot better at night just knowing that there is a "one eyed" back-up out there on the internet for the "Chaos Strike Back" that I own a legitimate copy of. (Check Deja News for my "CSB Juiced" posts. I came very close to losing my legitimate copy of CSB thanks to a spilled glass of fruit juice. Even though a Q-tip and rubbing alcohol saved the day (much to my suprise) I was even more relieved to learn that someone had finally cracked the copy protection on that game and a copy was available on the net).

I don't care which side of the argument you are own as long as you come up with real arguments for your case and don't just say, "It's wrong because it's illegal (in my country)."

I would think that the majority of the programs are either PD or SW since most of them came from a
local ST enthusiast BBS' archives and were on line for a number of years. The disks from the SW
library should also be fair game since a number of SW companies openly sold disks both here and in
Europe up until relatively recently. Also keep in mind that I'm not offering to upload Calamus,
Cubase etc (i.e, commercial sofrware), just what I assume to be PD or SW apps.
You concerns are well founded concerning the cover disks, though. That would be a murky issue. Is,
for example, trading a commercial program from, say a ST format cover disk containing KCS Omega, the
same as posting the venerable Cubase crack? I would think not, though I acknowledge that there is
probably a licensing issue involved here. I would have to consult the disks read me directly.
BTW, I should mention that I am, in no way, advocating SW piracy, eventhough none of you have
brought this up. <g>
 Maybe, if I get a bit of time, I could upload a listing of the directory of each disk to this
group and we could take it on an app by app basis. I'm sure that the apps that I have are probably
of little interest to the die-hard Atari user or archivist. I just thought that they might be of
interest to those who are new to /|\ianism--those who didn't have the benefit of Hensa et al.
Although, I've since become a platform traitor, I just want to give a little bit back to /|\
community that was so supportive to me when I was still trying figure this computer thing out.
In retrospect, without the help of these news groups, I probably wouldn't be where I am now--working
as a web developer/musical content provider.
 I came up through CAB, KCS etc, learning to do things the hard way--the right way, the off-hand
intuitive way. I learned to code pages pages using a primitive version CAB (is it compliant yet?),
my trusty Mega, and a unix shell account. I spent countless hours coming to grip with Uniterm and
setting up my 2400 modem, learning all the way. I even learned programming by

writing editor/librarians for my synths in Gbasic! To further date myself, I bought my first 520ST(no FM then) with the outboard single-sided drive brand new and was hooked from the start. I never looked back at my C-64 and SCI midi card again.

Now, I'm mired in the PC/Intel/Windows/Mac world (you have to make a living<g>) and can't help but wonder if it wouldn't be a better world if Bill Gates' father had ponied up the cash for an ST for his son! Everyone keeps saying that Gates made his fortune by making a PC emulate a Mac. This is patently wrong! Windows owes more to Neodesk than anyone will admit. Everyone here knows that it took several revisions of the apple OS to even come close to ND! Things like shortcuts and desktop images immediately come to mind. It took Apple forever to incorporate such things into their operating system!

The Atari--the little engine that could, but which everyone but the users ignored. Tramiel made his cut and left the users to fend for themselves...Pity, when I bought my first ST, I thought that I'd seen the future of PC's.

AFAIK, CD Tool, Metados and Spin will work with an IDE CD ROM.
Extendos does not support IDE devices, and I don't think that CD Recorder Pro
supports IDE drives (I haven't taken it out of the box yet:).

ATAPI CD-ROM, yes. CD-R, probably not.

I have an old 4x Samsung ATAPI in my Falcon, it works very well with BetaDOS, the ATAPI BOS-driver from CD-Tools and Spin! CD-Tools is commercial, and AFAIK there are no free ATAPI-drivers available.

However, if you have HD-Driver >= 7.50 it can control ATAPI CD-ROMs through it's internal SCSI-driver interface. This means that CD-ROM drivers that use this interface will (most likely) also be able to use ATAPI CD-ROMs:

ATAPI CD-ROM <-> HD-Driver <-> SCSIDRV-interface <-> SCSI BOS-driver
([BM]etaDOS) <-> filesystem or application

Phew! Life was easier with 8-bit systems...

Try finding a CPU-less Afterburner, or glue it on the case for decoration.

If that's the case, then no problem. Other than most shareware/freeware
stuff is already available on the main Atari FTP sites. Uploading lots
of files would be no fun for the administrator if you haven't already

checked in each archive that the file isn't already there.

There is also some PD stuff for which the authors have authorized specifically PD libraries as the only legal distribution media, opten because the prgrams were written before the Internet was even heard of.

This is possible if the IDE CD ROM drive is an ATAPI drive. This is usually the case unless your drive is several years old. Several CD ROM drivers are available, e. g. SPIN! (www.muenster.de/~reschke/):
CDR software is offered Soundpool (www.soundpool.de). I think there is also software coming from England.

I agree wholeheartedly with you, but just because "you feel it is right"
won't prevent your ISP from pulling the plug if they receive a complaint
from the IDSA.

On the other hand, I have the feeling that our community has gone
through the phase "it's illegal, let's not discourage development on our
platform". I think this has failed, and those companies who might have
came back have given up on Atari forever.

I think that now the best attitude we could adopt now is maybe make the
software available, and if anyone complains, remove it. Of course, this
excludes products that are still supported, like Calamus or Papyrus,

etc... but it would free us up quite a lot and finally would help promote our platform. In french we say "qui ne dit mot, consent", which means more or less "silence means consent".

I know that many of my Atari friends will get up in arms and flame me for even thinking, let alone suggeasting this:

I have wanted, secretly, for many years, for some smart hacker to go through the back catalogues of the many copy-protected MIDI applications for the ST, and hack 'em so that they were `normal'.

I have a legal and paid-for NOTATOR SL, but that accursed dongle causes many problems in my 1040 so that I have to have a dozen different boot situations, depending on when I am going to use Notator, or when I am going to use Notator and print from within the program. I know that 90% of Notator's fussiness with data registry is from that dongle.

I met a musician in another city and he is using some old MIDI program which only runs off the master disk. In some strange twist, that disk is still sort of playable, on certain days, after all these years. Needless to say, he is frightened to runn the program one more time lest the disk expire and his entire back catalogue of compositions be lost forever.

If life was less complicated:

you could plug it in.

My advice is: buy a Milan do-it-yourself kit minus CPU.

Hi everyone,

With some friend Piloteers I use an Atari Falcon to HOTSYNC my PalmIII
with the Pilot Tools by <rodolphe.pineau@capway.com>, a Linux port.

http://www.chez.com/pilot/

We run these tools under MiNT/NAES, a LINUX-like OS.

Sadly, our desktop computer (Atari) has got a different ASCII set than
the Pilot, so when we export the addresses into a CSV file, chars above
ASCII(128) get mixed up - you know, the European special chars! - and
we would like to program a conversion tool for it.

What ASCII set does the PalmPilot use?
Is it an ISO set?
Is there a (freeware/shareware) conversion tool on ftp or www?

Greetings,
Jan

<36cd35fe.25193823@news.freeserve.co.uk>...

:No risk you say. and is that your excuse. there is no risk so why not
:do it.

:It is illegal. try to grasp that concept.

The roman law's backbone is the protection of property.
My first question was what if the part (company) that is to be protected doesn't exist? Can the copyright still be considered to be valid then? I doubt it.

The second question was derived from a brittish saying:
"Possesion is 90% of the law."

Translated to software this should mean that if I own a piece of software I can do pretty much what I want with it.

I can, for instance, make one single file of everything, rearrange the bits and bytes in a certain pattern (scramble it) and give away this rearranged copy with instructions for how to arrange everything back to original (descramble it).

Technically nothing illegal would be done.

I can also take my software to a country where there is no copyright law (many eastern european countries) and give it away there or from there. Again nothing illegal.

The Internet complicates matters even more.
The law has problems with exterritorial "crimes". Where is a copied software on Internet made illegal? In the coutry of the originating server or in the country of the destination computer?

If I "confess" to have copied Dungeon Master several years ago, how long after the "crime" is this punishable?

I suspect that your statement "try to grasp that concept" is supposed to be a moral one? Maybe you should start teaching that concept to your countrymen first? Is it not "illegal" to steal archeological tresures from Greece and display the loot in a museum, for instance?

MG

I really don't know that mush about the Pilot, but my first guess is that it use Latin-1 (ISO 8859-1).

> Is there a (freeware/shareware) conversion tool on ftp or www?

Not that I know of, but if anybody's interested I can very easily hack together a filter you can pipe the text through. I already have the translation-table (from TosWin2) so it shouldn't take more than five minutes to make it, testing included.

There are good and easy ways of making backup of protected disks. Try the Blitz copier, requires two diskdrives and a special cable, which you can make yourself.

With the Blitz copier I have only failed with one single (boring) game thisfar. The Blitz copies the disks in analog mode, like you'd copy music tapes.

I've heard there is a version for the 1.44Mb disks as well.

Legally you have the right to make as many copies as you like from software you own.

I have a Deskjet 500c and am looking for printer drivers for Atari software. I found some on the internet but am looking for a specific software product. It was developed by Scott Sanders of Software Development Systems of Long Beach, California, I tried several times to locate him or his company but was unsuccessful. He wrote several programs for the deskjet, can you help? Thanks for your assistance.

I still use my Atari Mega4 STe and have recently purchased a HP Deskjet 500C. I was surfing through the net and found that a Scott Sanders of Software Development Systems out of Long Beach, California had written several programs specifically for the deskjet but am unable to locate his company or him. The article was written in 1991. Do you know of his software package and where I can get it. Thank you for your assistance.

The 1040 did not have an internal hard drive, and it should have a double sided 720K disk drive in it. I have three in my house plus a mega4 st and a mega4 ste. I use the mega4 ste.You can usually buy the disks at a computer show, they are hard to come by. I don's program for the ST but some cities have an Atari Computer show and one can pick up the software you may need. Check your local paper or get on the net and type in Atari ST and you should be able to find someone who has the software you need. Sorry I can't help you more. I am also looking for older software.

Umm. There isn't a moderator...

> concerned user
> will,_again_.post the ftp sites on a regular basis for the newbies.

Hallvard posts the FTP site list on a monthly basis. Latest one was last
week IIRC. Also available via FTP at:

ftp://ftp.sol.no/users/h/hallvart/atari/info/ftplist.txt

And via the web at:

http://www.geocities.com/SiliconValley/Bay/8745/atari_ftp.html

> Hensa is history

The HENSA archive has been transferred to Danny's own site at
hensa.cyberstrider.org, IIRC.

> where are the
> groovy /|\ archive sites? Post the sites,

As I said, the list is posted monthly and is mentioned in the Quick FAQ too
(http://quickfaq.atari.org).

Maybe I'm not up on my Atari history the way I should be, but wasn't the software priacy that occured in the late 80s one of the reasons compainies moved away from the Atari platform? Was the priacy that went on back then worse for the Atari then for other platforms (I've often wondered about this)? Of course the rise of Windows and the mismanagement of Atari were probably the most important factors in its demise.

However, if piracy succeded in chasing off developers, then I would find it ironic that the argument is put forth that since these companies no longer exist, it's alright to distribute their software illegaly when it was this practice that drove them out of business to begin with.

>What ASCII set does the PalmPilot use?

I would guess it uses a Standard ISO set.

>Is it an ISO set?
```

Probably. The problem is the Atari that doesn't use such a set.

The only workaround I see, would be to use an ISO font, like a TTF font from microsoft, and then use CKBD to remap the keyboard to use the correct characters.

This won't convert any files you've already made though. For that you would have to use the "search and replace" function of a text editor like Qed or Everest...

There's no moderator in c.s.a.s, but Hallvard Tangeraas usually posts an
updated list every month. You'll also find a link to it in the Quick FAQ.

The main FTP sites nowadays are umich, lip6n paderborn, funet, and the
nameless belgian FTP. You'll find the exact URLs in the FTP site list.

Scott Sanders of SDS no longer has an Atari nor uses Atari products.
I don't know of any dealers who have this in stock, but you should
check
It is a good package of software, but since I purchased Scott's
SLM-605 which he hadn't used in over a year a couple years ago, I
think he's long since moved on. He was one of the final Atari
employees and is now developing PC Software if I recall correctly.

Switching-type power supplies should NOT normally be operated without
a fixed
minimum load of approximately 10% of rated capacity. Provide a
suitable load
resistance if any PSU leg is disconnected from the computerboard.
Perhaps this
is the cause of your high readings, and there is nothing wrong with
your PSU.

Hello,

It all started a few days ago when all of the sudden I couldn't access
my internal SCSI-devices anymore. If I tried to access my CD-ROM I
only got an empty window.
I ran ID-check which showed me some very strange values:

```
     SCSI ID = 1.0 PHNNDDR BD, RNL DR,TT22X Write once
     SCSI ID = 1.1 PHNNDDR BD, RNL DR,TT22X Ger�tetype unbekannt
```

```
Normally it should be SCSI ID = 0.0 Zip drive.........
                      SCSI ID = 1.0 Pioneer 32x.......
```

I switched off the Hades for a few minutes and initially everthing was

just fine after a new start but alas not for long. Unfortunately I only noticed this when I tried to access the Zip. I just couldn't but instead of anempty window I got a message box on screen now saying: "Geneller Ger�tefehler"
Whatever buttom I tried I couldn't get rid of that box. So the only possibility was a reboot.
I've waited at least 15 minutes before I switched on the Hades. This time however the system didn't find the bootdisk which is located on an 2.1 IDE harddisk so it tried to boot from floppy.
I tried to boot from floppy. The HDdriver saw the IDE and SCSI devices but it also returned me a very nasty message: " No partitions found"
The day after the problem was even worser. No SCSI-devices anymore but still that "no partition found" message.
I decided to remove the SCSI flatcable. When I opened the tower I noticed that this cable was connected like this:

```
|4|-------|1|------|2|
                    |
                    |
                   |3|
```

1) The SCSI connector on the motherboard of the Hades
2) Zip drive ID=0
3) CD-ROM ID=1
4) External SCSI 2 connector terminated by means of a active
   terminator.

I wonder if this can be the culprit of my troubles. For me it seems not the right way to make a SCSI-chain.
As there were so to speak no partitions I couldn't write a HDdriver on the IDE. HDdriver do see the IDE but......

What is the problem here. IDE down or a major problem with the Hades?
If it is a HD problem I wonder if I can restore the HD without loose of data. My last backup date from a month ago:-((

TIA
Martin

Hi

I don't know about anyone else, but I wish everyone that asks or wants to sell their Atari items would mention the area they live in. I am not the only one that has brought this point up.

I don't expect everyone to have the location in their signature file, but something like USA, Canada, Europe etc.. would do if you don't want to be specific. Even Miami USA, Scotland UK, or France etc.. would be a big help.

This would allow Atarian's that are IN your area of the world to help. I don't mind tracking down something for someone in the USA, but it will cost more in shipping costs. If people have an idea where you are, without having to ask a question, help may be more forth coming.

It would be nice to see who else echo's or agrees with me on this one.

Hallo Martin, sounds awfull what happens to you.

Question: is [1] a single connector with a T-split?
Mostly cards have a connector for inside and one for to the outside.

Zip-drive: is it a Plus type? The one that knows intelligently if an parallel or a SCSI is connected?

Zip-drives with SCI have an recognition of 'terminator needed' that sometimes goes wrong. Advice: put him on end of chain with an external terminator.

Is the CD-ROM maybe with an internal terminator? Sometimes they have.
Mine had and a lot of trouble because of that.

I remember an advice: use the cable that is delivered with the drive!

Met vriendelijke groet,
Ronald van der Kamp

This is VERY much like the response I have had when there are bus termination problems.

```

```

Oh s**t!! Another T-configuration (just like the TT).

There has been a lot of discussion about how to terminate such configs. (because the terminators at each end of the 'T' are effectively in parallel).

Is the CD-ROM terminated?

Try the following:

Remove '4' - the active terminator on the spur.
Terminate the CD-ROM (if not terminated already).
Change the order on the bus of '2' and '3'.

I suppose this used to work OK. Funny it has suddenly decided to misbehave.

Perhaps the cabling is strained/falling off :-)

You are absolutely right!! And don't forget about the different television systems too! I once bought an Atari computer in Canada, where the NTSC is common.
The seller was very honest, and told me before this could be a problem. I wanted the computer at all, so we made the deal.

So I agree with Steve Stupple!

Btw I live in The Netherlands, running BBS the ATARI Inside on 800XL, supporting most of the atari computer systems. online: 22:00-08:00 (CET!!). +31-182-352755, the bbs is completely FREE!

I must agree, you can't always guarantee that the country (if any) used
in the address is relevant anyway.

You don't have to be specific like my signature, something like UK, USA,
Canada etc.. even Europe would do.

I've seen adverts in the UK only newsgroups that aren't in the UK! You
really can't tell unless being told.

The format that the desktop formats are:

80 tracks per side (0-79)
9 sectors per track.

With a sector size of 512 bytes.

The most common used format, which you need to use a third party program like Fastcopy. Most format programs do extended formatting.

81 tracks per side
10 sectors per track.

With a sector size of 512 bytes.

DO NOT try and do a disk copy from the desktop with the above format, as this will only copy the 80/9 disks. If you do you'll lose a track and a sector of data off each track.

The sides of the disk are as follows:

Side 1, A or 0 - this is underneath the disk.
Side 2, B or 1 - is the opposite to the above.

When you are talking about formatting, there are many combinations you can do.

You can even have sector size of 1024 bytes, obviously you can't have 9 sectors of this size let alone 10.

You can mix them say: 2 x 512 bytes and 3 x 1024 bytes in you want.

The sector sizes that can be used are:

128
256
512
1024

Some disk protections take advantage of this as the run of the mill copy program can not duplicate them.

There are a couple of old game program disks that were produced used a larger sized boot sector, and so will not run on all ST models. This is because the boot sector has to be 512 bytes to be read and acted upon; I haven't had my hands on the original (the first model) ST, the one with a tape input socket, but all those I have had/have all require a boot sector size of 512 bytes to boot from.

I hope this helps;)

>>   A - what kind of disks it uses
>
>Double sided double density (DSDD) 3.5" disks. 720K

Use double density disks if you have a double density drive, this is the disk that has one hole with a little slidey thing to cover it; this is the write protection thingy;) The high density disks have an additional hole.

Most Atari drives I've come across cannot be trusted using high density disks. If they can be read one minute and not the next, then you know that you data security is not going to be secured.

None of my ST's fitted with a standard DD drive cannot read HD disks without difficulty, they seem to write to them and format them OK. I have to use an external drive with a larger (I can't remember the word, it's not as sensitive or something like that.

Strangely my ST's high density drive can't read high density disks written by an Atari!!!!!

>
>>   B - where I can get said disks

I am hoping to find a supplier for the disks, in the very near future. I used to use ex-software disks, but the supplier I got them from no longer exists.

If anyone knows of one please let me know.
>
>Some shops still carry them. If you can't find any, just get some HD disks
>and stick a piece of tape over the HD hole. This makes them less reliable,
>but it often works.

Why tape over the HD hole???? I wasn't aware that the switch that senses the HD disks are there in DD drives!
>
>>   C - If and how I can run a system diagnostic

I recently obtained a complete 520ST system that was saved from
the Garbage man. Everything works fine. My question is about the
external drive that with it. The model is the S314.

Can replace the mechanism with a 1.44 mech to gain the Double Density? or do
I have to search for a complete S354 drive?

Any help would be appreciated.

Thanks

Korris

Because if he plans on using the disks to tranfer files from a PC, the PC
will not recognize the format because of that hole.

Probably because he doesn't know how much RAM, TOS, etc... he has on board.

Actually, the 314 was the DS version. For some reason, the better model had a smaller number than the single sided version.

I don't have the application on this machine, but there is one
called something like reset nvram (of course shorter) that will put
you back to the defaults. No harm done:).

My pc first tries to read in HD mode. If this fails it tries in DD mode.

��Vector graphics exported as EPS from Bridge always worked well from my
��experience. On the other hand, attempts to dump a complete Calamus page
��to a PS-equipped printer always failed, notably because of positioning
��problems with certain frame types.

I never used that, so no comment.

��There's a very expensive PostScript module available for Calamus, one
��that I tried in beta form a few years ago. I'm not sure how it's
��progressed since then but it did support PS-level-2 and was quite fast.

I use it nearly daily, and it works very very well. It's fast and easy to use, and the result is good (but files are very big...). But, to use it, you need a PS-printer that accepts level-2 binary PS (quite common now), a 8-bit connection between printer and computer (not always done, especially with network printers...).
Be also careful with page size�: some apple printers just don't print if the page size is not one of the standard one... To ways : remove the "setpagedevice" lines in the PS file or play with printing margins in Calamus.
Sadly, this driver doesn't handle two-side prints and can't produce color files for PS color printers (only one-file by plane...)

The driver is made by adequate systems and there's a demo on their site (something like http://www.adequate-systems.de)

Check out the Quick FAQ for connector pinouts, but make sure your multisync is capable of displaying the ST's sync rates.

Actually!

It seems that Edison.acc and other screensavers, once installed,
don't like changes to the video settings. Hmmmm.

I guess the reason for having it's own harddisk code is to avoid fragmentation, but as you said it's probably just as fast and certainly much more compatible to go through the driver (but not the filesystem).

>fairly simple to fix.

I've followed Roger's advice and discovered that, rather than being too low, the voltages are high. Unloaded the PSU gives nearly 7v on the +5v line and under full load it remains at about 6.1v ; the 12v line is over 15v unloaded and close to 14v loaded; the -12v is close to -15v unloaded. Only the -5v line is nearly spot on in unloaded condition.

Measured at an electrolytic on the ST ram daughter board, the 5v supply is still an overly healthy 6v.

Is this normal? Is the regulation of the PSU shot? Could over voltage to this degree (20%) cause the symptoms I am seeing?

I've used two multimeters, one digital, one good old-fashioned, and they agree closely, so it's not measurement error.

David

Which doesn't make sense because CAF can't access a drive faster than a normal hard disk driver can. All the well-known incompatibilities which large partitions etc. result from CAF having its own hard disk code which doesn't support partitions that are perfectly legal for TOS.

The SF314 is a DOUBLE DENSITY drive.
The SF354 is a Single Sided DD drive.
A 1.44 Mechinism is a High Density Drive.
You would need to install an Ajax chip I believe.
Go to Hallvards Page and locate his ftp site for
Sony 1.44

ftp.sol.no/users/h/hallvart/atari/
(194.143.8.25)

This should make it clear. Now perhaps you could check the garbage for a
second machine:-).

You can avoid fragmentation without using your own hard disk code. Any hard disk driver allows to write sectors without using any filesystem-related operations. There are always two ways to write data: Using GEMDOS and the filesystem or directly reading/writing sectors. Even the oldest versions of AHDI have a documented interface for reading/writing plain sectors and other drivers are compatible to this.

If you run MiNT or Linux you can use Samba (a freeware clone of the
SMB printer/harddisk sharing systmem found on windows) or NFS to share
data between machines.

To connect the machines, use an Appletalk cable on the TT's LAN port.

It is very seldon that voltages are to high, mostly the are to low.

But I think that this can be the source of the problems.
Especially memory chips for 5 V can work mostly between 4.7 and 5.6 V
as datasheets tell me.

:>>>Karl at Systems Solutions here in the UK said that he thought that it
:>>>was very easy to install, aided by a very clear manual.

:>>Sure he say that, he's a profi :)

:>Encouraging people to fit their own means that he loses the business tho'!

Ive seen lots of Amatuer installations of gadgets, not a nice sight, I'd defo. recommend the pro service, not many Hams take adequate care with ESD's, not many more can solder properly.

:>>Well the manual is clear, for profis. Other people have questions left.

Perhaps they should reconsider DIY'ing

:>>>Me, I'm most concerned about the possible need to replace some parts removed

:>>Right, the only part you have to replace is R216, 33R (Ohm). CT2 doasn't
:>>work without them.

:>Thanks. (Thinks - could I use a low wattage resistor instead?)

Do you have prob's getting SMD's, you wanna squiz my CPC comic??.

Perhaps the size of the device might be critical in a HF circuit, better to use an identical. Did you keep the one's you removed.

:>Hmm, maybe I'll be lucky - but what of my Microtek scanner (with ScanX),
:>my CD ROM, Syquest, tape streamer (that's ancient!)

That'l work with a good lube job. 8~))

Hi,

Anybody interested in a "CARE Electronics" cartridge (made in england)
designed to hold two E-PROMs or UV-PROMs or ROMs , that plugs into the
cartridge port of an ATARI ST ? Right now, it holds two UV-PROMS containing
the Macintosh 128k ROM software (to use the Spectre Mac emulator).

Dimensions : 85mm x 55mm x 22mm

Asking price : $12 or 12 Euros or equivalent, including surface post

I have a Tandberg Data TDC3620 internal SCSI tape streamer with 22 x
60Meg tapes and one head cleaner.

An ideal way for backing up those cluttered drives.

I'm open to offers, if you've got some other hardware or software to
swap etc... postage will be extra.

That's all my 672C has.  TBH, I never felt the need for more buttons.
Maybe because I've always owned DeskJets.

What other buttons would you like?

I guess anything else you might need would be in their Windows
software.

yup, ditto that.

have a well loved 1985/86 (??) STF with double sided disk drive with a Monster button on it! :)

the disk drive has actually outlasted the machine's video system somehow.. anyone who has a PC that's done this, i'd be very, very interested....

they just dont make them like they used to.

(thank God for that!)

If you see anyone selling a sega master system cheap with joypad(s), grab it. They work excellently with the ST and in some cases are better than a joystick for many games (esp. platformers and some racers) Strangely enough, both buttons 1 and 2 fire the single ST joystick button!

I have a DJ 870Cxi with my PC. It seems to be compatible with text
printing and can handle anything you throw at it in DJ-500 mode, so
compatibility isnt much of a problem there. I don't know about
compatibility with older colour DJ drivers though, I may test that out
at some point. Cool printer though. Three colours plus black. 600x600
B/W, 600x300 colour, MEGA fast when doing black and white in draft
mode.. faster than it's 6 ppm rated speed in some cases. :) :)

Not many buttons though. That worries me. It has power on/off and paper
feed. That's it. Why oh why?

Good news and bad news.

Following my discovery that the TT's PSU had over-voltage outputs, I substituted the PSU from my MSTe and that seems to have cured the fault (fingers crossed). So my problem is with the PSU.

Does anyone know where I can find a wiring diagram for the TT/MSTe PSU? The Schematics Mania site diagrams don't seem to include the PSU, unless I have missed it.

David

I haven't checked out these news groups for quite a while and decided to wade through them tonight
and it kind of rekindled my atariphilia of old. My still occasionally used Mega 4 smiles as I write
this<G>
I have about 70 disks of old Atari programs from Antic, St-express, the MAST (Minnesota Area ST)
archive, SW libraries, cover disks etc. Are these still of any interest to anyone? I'm not talking
money here, I'll make arrangements to upload to either a USENET group or will post them on the W3
if anyone is interested (if I can keep my PC from devouring them or get ambitious enough to find my
old 14.4 and reconnect it to the mega). Anyone interested, are these ancient ST programs still
needed? Are their still Atari archives? I'd also consider trying to e-mail them to someone who is
willing to redistribute them to the /|\ community.
E-mail me directly as I don't often read these groups (my Mega does what I want it to and the PC
picks up the slack!)

Thanks for the offer, I should be OK (famous last words!) ;-)

>:>Isn't there some problem with HDDRiver and IDE drives tho', or am I
>No, wanna demo??.
This is purely a CT2 issue, HDDriver works perfectly with the IDE that I
have under M6 or TOS4.4.

That's definitely a no no !

> or will post them on the W3

The problem is copyright. Although these programs are old, they are also
still under copyright. You have no right to upload them anywhere. You
can give away or sell the originals though.

Good joke if you remember that even high end PCs with UW-SCSI won't come
near 20 MB/s. At least not with hardware you can afford.
If you want an Atari compatible machine with fast SCSI right now, get
yourself a Milan.

on board memory chip.

Fix will depend on how technical you are & whether you have
time/equipment/ability to locate the fault. Might be as easy as replacing a
hot memory chip on the board. cuold also be a bad soldered connection.

Hi

This looks like a mammoth task, the combination of programs is unlimited. I have a boot-up sequence that has several permutations depending on what I am going to do.

And when trying/testing software out, sometimes they cause a clash on a specific program and sometimes they don't. I have a Kobold boot sector on the disk in the floppy, this sometimes cause the computer to bomb out every now and then; I've no idea why and thankfully it doesn't do it often, but when it does it can be a pain in the backside to get up and running, I tend to switch off for a few minutes.

A list of what doesn't like what would be ideal, maybe there is one!, as opposed to a list of in which order; if I've got hold of the wrong end of the stick then forgive me my painkillers are working yet:((

>come up on the screen. What is that?

I only advise owners to do the drop method if they may have trouble with stripping it down. Stripping the machine down to the motherboard and make sure the IC's are seated fully is the first choice although it's takes some time.
>
>Are the power supplies in the "e" and "f" model compatible?

I've been using a PSU from an old STF in an STE for several years now without any problems.
>
>Are the two socketed chips on the Ste's the TOS ROM's?

Near/under the disk drive! yes;) they can be either 28-pin or 32-pin IC's.
>
>Are the 6? socketed chips under the power supply on the STf's the 1985
>copyright TOS ROM's?

I have seen 3 different arrangements for the TOS chips, the most common has been either under the power supply or in front of the PSU. These come in a 2-chip or 6-chip flavour.
>
>I have swapped parts around and have found that of 7 computers, 4 have bad
>disk drives. If I find a 720K drive somewhere, will I be able swap the
>brown-beige face plate from the original drive to a generic PC 720K drive?

With a little bit of blue tack or something then it may be possible! even some Atari internal drives don't have the same type of fastener/clip that keeps the face plate on it.
>
>Most posters seem to live in Europe. Does anyone have any information or
>"theories" on why the ST seems to have been more popular in Europe than in

I'm also concerned that the Falcon's PSU might not have enough "guts" to power the CT2 plus the 32Mb SIMM and the original memory (which is a 16Mb SIMM).

I suppose that I'll put the original 4Mb back in as I doubt that I'll need that much "STRAM", I could then sell the 16Mb SIMM to recoup some of the cost of my upgrades.

As a general piece of advice I suggest making a screendump of XBoots's running order screen once a suitable running order has been found.

Or better yet, find yourself a secondhand HADES040, this one can run progs
like CD Writer Pro and Scan X. For some strange reason these don't work on
a Milan. You will also be able to go on internet without having to install
a buggy betaversion of HSModem.
Think of this, A Milan with a Soundblaster, SCSI Card, SCSI drive and to make
it complete a decent Graphic Card, will cost You just as much as a HADES060.

If You're a Falcon owner, stick with it and install the Centek, You'll save
a lot of money, be able to access your IDE and SCSI drives at high speed
>4MB/sec and as a added bonus still have a DSP somewhere in there also.

Well the problem here is voltage/current delivered to pin 3 and pin 6 of the pc connector.

The fire buttons are easy, just wire them so that one button closes the connection between pins 2 and 4 and the other closes the connection between pins 7 and 4.

I think left movement (or is it right?) is achieved by applying 5 volts to pin 3 (pin 1 supplies this) and the other direction is achieved by about 0v connected to the same pin. The trick is then to have about 2.5V connected to the same pin to achieve 0 movement. In other words, with the joystick central, pins 3 (x direction) and 6 (y direction) of the pc connection need to "float" at about 2.5V

Therefor, a possible solution may be to have two 20k variable resistors (variable so that you can centre the sucker) between pc pin1 (5v) and pin 5 (0v) with pin 3 connected to the wiper of the first and pin 6 connected to the wiper of the second variable resistor and the respective movement switches wired to short out the resistor corresponding with it's movement. You would have to cut the tracks joining the 0v reference to the movement switches on the Atari joystick and the common junction for up/down would then connect to the PC pin 6 and the common junction for Atari left/right would connect to the PC pin 3 and the left/right common junction would have to be disconnected from the up/down pair.

Then you would, maybe, have a joystick that would be either dead centre or full left, full right etc.

hi, i'd like to set up an IDE hardisc (once from the F030) into my 1040ST
i couldn't get hold of the manufactured IDE-Interface here in berlin/germany
and was wandering if it's sooo difficult, to built my own one ?!

anyways couldn't find sensible resource on the web, yet - any help ?!

regards

ok, i wrote an asm-VBL-routine to save the screen with GEMDOS calls -
ok too, i've heart it's not re-intrant, but how should i fix that little prg
to stop it from crashing everytime it has saved the pic ??? (:

switching of interrupts while saving didn't help very much and to honest to
re-invent own saving routines wont tickle my fancy ...

any ideas ?

Below is the zero:th issue of a new swedish email-based Atari magazine with the name AtariPosten. Sorry, but there will not be any translation to English! This is just a way of skimming for those Swedes who read Usenet postings. Maybe as a not-Swedish speaker you could get something out of the various schematics for cables between the F030 video port and monitors? It�s in the end of this issue. You can subscribe to AtariPosten wherever you live, no matter if you understand Swedish or not. Just send an email to Atari_Posten@bigfoot.com with the word "Subscribe" in the body. AtariPosten is completely and absolutely free for all!

```

V�lkommen till nollte utg�van av AtariPosten, ett epostbaserat forum f�r Atarirelevanta fr�gor! AtariPosten kommer behandla Ataris ST, STE, TT, Falcon och kompatibla maskiner. N�gon t�ckning av Jaguar och uddamaskiner kan f�rekomma. Dock g�r gr�nsen vid 16 bitar. De gamla 8-bitars maskinerna kommer INTE diskuteras!

Varf�r en ny Atari publikation? Dels f�r att det inte finns s� mycket att v�lja p� om man har svenska som modersm�l och dels f�r att allt inte blivit sagt i andra Atarirelaterade publikationer!

Meningen �r att kunna ta ut sv�ngarna ordentligt just genom epost formen. Skulle man vilja publicera l�nga listor p� modempooler eller inst�llningar f�r skrivare i First Word Plus s� m�ste en papperstidskrift alltid t�nka p� hur mycket det hela tar upp i sidor, hur mycket extrakostnader dessa sidor kan dra, hur annat material skuffas undan etc. Ett epostblad beh�ver inte bekymra sig om s�dana saker. S� l�nge vi h�ller oss till text kan vi skriva n�stan hur l�nga artiklar som helst, bilder �r en annan visa�

AtariPosten kommer publicera bilder endast i yttersta n�dfall, i �vrigt kommer vi h�lla oss till "ASCII-konst".

Eftersom det finns s� m�nga olika standarder och program f�r eposthantering kommer AtariPosten skickas ut i n�gra olika varianter. En blir ISO8859-1, en annan 8-bitars (Atari-)ASCII, en tredje 7-bitars ASCII, f�r dom som inte kan f� vettiga ��� med n�gon av de andra varianterna. ��� kommer skrivas som AA, AE, och OE. F�rutom hanteringen av svenska tecken kommer versionerna inte att skilja sig fr�n varandra. Ytterligare anpassningsvarianter kan komma att dyka upp i framtiden, allt beroende p� behov. N�gon tryckt version planeras inte f�r framtiden, ej heller st�r jag till tj�nst med att skriva ut delar eller hela AtariPosten p� papper. Dock har jag inget emot om n�gon annan k�nner f�r att g�ra detta.

AtariPosten f�r delas ut �ven till "utomst�ende", delar av inneh�llet f�r publiceras i andra tidskrifter med angivande av k�lla och med copyrightinnehavarens godk�nnande (dvs mitt). Distribution via BBS, Fidonet, disketter mm uppmuntras. �vers�ttningar till andra spr�k likas�. Dock f�r AtariPosten eller utdrag ur den inte s�ljas! Om du bygger kablar och annan h�rdvara som beskrivs h�r f�r du givetvis ta betalt f�r det. Kommersiell tillverkning i st�rre skala m�ste betala f�r sig.

Det kommer finnas en "annons-h�rna" f�r k�p och s�lj av relaterat material, eller f�r hj�lp med inst�llningar, utskrifter mm. Annonseringen blir givetvis gratis f�r privatpersoner!

Detta 0:te nummer kommer skickas till Atarianv�ndare som �r med i SAK och har epost, samt till andra Atarianv�ndare som jag k�nner till. �ven Fidon�tanv�ndare kan f� AtariPosten till sin Fidoadress. Dessutom �r det t�nkt att �ven folk med fax ska kunna f� AtariPosten. Dessa m�ste dock sj�lva anm�la sitt intresse d� ju o�nskade faxar b�de kostar faxpapper och kan orsaka irritation�

Skulle det vara s� att du inte vill f� flera publikationer av AtariPosten �r det bara att REPLY-a p� detta brev och skriva:
�Inga fler AtariPosten!� (utan � � tecknen!).
Inga ytterligare f�rklaringar beh�vs.

Har du bekanta som �r intresserade av att f� AtariPosten �r det bara att skicka ett ebrev med texten �Skicka AtariPosten!� och s� mottagarens e-adress, fidoadress eller faxnummer.

Om AtariPosten verkar konstig vad g�ller svenska tecken b�r du skicka ett mail och ber�tta vilken version du tror du vill ha.
Adressen �r alltid:

Atari_Posten@bigfoot.com

Anv�nd inte min privata e-adress f�r kommunikation som ang�r AP, det �r m�jligt att redaktionsuppgiften �vertas av n�gon annan och i s� fall ska ju posten inte forts�tta g� till mig utan till aktuell redakt�r.

AtariPosten:s storlek och utgivningstakt kommer vara helt godtycklig. Finns det n�got att skriva om kommer AtariPosten skickas ut.

```
+-----------------------------------------------------------------+
|                                                                 |
|                      __         _   _   _                       |
|                ___   /_\ / /\  /_/ /_/ /_  ___                  |
|                     /_/ / /_/ / \ / / /_/                       |
|                                                                 |
+-----------------------------------------------------------------+
```

Artiklar, texter, nyhetstips tas tacksamt emot, dock kan jag inte garantera att det som skickas in kommer med i AtariPosten. Texter b�r skrivas med samma teckenbredd som denna utg�va av AtariPosten, dvs 72 tecken per rad. Anv�nd en monospace font som exvis Courier. Spr�ket �r i f�rsta hand svenska, i absoluta n�dfall engelska.

K�serier, filosofiska utl�ggningar och allm�nt mummel skickas med f�rdel till USENET eller FIDONET, inte till AtariPosten! Speltips och fuskkartor kommer inte heller tas upp i AtariPosten. D�remot v�lkomnas erfarenheter av diverse h�rd- och mjukvara. Tips, inst�llningar och fr�gor �r ocks� v�lkomna.

Givetvis undanbedes olagligheter av alla de slag, liksom politisk propaganda, rasism, tarvligheter, personliga p�hopp etc. Inte heller kommer avhandlingar om PC kontra Mac att publiceras. D�remot kommer Internet bevakas.

Honorar utg�r tyv�rr inte till skribenterna! Hela id�n med AtariPosten �r ju att det hela ska vara i g�rligaste m�n gratis. Varor som k�ps eller s�ljs kan ju inte vara det, av f�rst�eliga sk�l. L�sarna uppmuntras att sj�lva bygga sina kablar, tanka sina program, etc. De som inte kan eller vill erbjuds, som en service, att k�pa f�rdigt.

Det vore kul att f� in lite ber�ttelser om hur ni l�sare anv�nder era maskiner. OK, ordbehandling, spel och kommunikation beh�ver ni inte skriva om, det h�ller vi n�ra nog alla p� med! Ovanligare till�mpningar, finns det? Sj�lv br�nner jag EPROM:s med min Atari, som tydligen inte �r s� j�ttevanligt.

F�rmodligen kommer framtida utg�vor vara n�got smalare i omf�nget, men komma ut oftare ist�llet.

```
+-----------------------------------------------------------------+
|                                                                 |
|                          _   __   __ _                          |

|                                                                 |
+-----------------------------------------------------------------+
```

Helgen 12-14:e juni h�lls �terigen NAS i G�teborg. En hel del gamla "die-hards" (ungef�r: s�na som inte vill d�) var d�r, bl.a. jag sj�lv.

Intressantast var nog presentationen av Milan med M68040 processor, samt att f� kika p� Erik H�lls grymma Hades maskin.

Annars s�ldes Jaggor f�r 400:- och exklusiva Fujismycken till slumppriser. En del folk h�gg tag i mig och gr�t mot min axel, n�gra kunde jag hj�lpa med deras h�rdvaruproblem, andra hade ol�sliga problem. Man kan inte koppla in en icke-IDE CDROM spelare till Falkens IDE-buss! Det finns gamla "halv-IDE" interface som de olika tillverkarna sj�lva hittade p� f�r sina fabrikat. Tyv�rr finns det, mig veterligen, ingen m�jlighet att anv�nda dessa p� Atari.

Om du har en h�rddisk som finns d�r men vars nyinstallerade partitioner inte vill bli igenk�nda, f�rs�k med att boota om mellan turerna, det ger b�ttre resultat. Om SCSI-porten p� din Falk spelar apa kan du bygga in den k�nda klockpatchen med en 74F04. F som i FAST, dvs snabb. Det hj�lpte i alla fall en av bes�karna!

I �vrigt fanns d�r korv och kaffe, samt ett par v�lbes�kta pizzerior i n�rheten. L�get var p� F�rsta L�nggatan som b�rjar fr�n J�rntorget i G�teborg. F�rbindelser saknas inte. Hur mycket bussar och sp�rvagnar som helst, samt cykelbana och direktf�rbindelse till Danmark via Stena Line!

M�ste ber�mma arrang�rerna f�r en mycket bra tillst�llning!

```
+------------------------------------------------------------------+
|                                                                  |
|                *_*  __  __  _       __      __  __        _      |

|                                                                  |
+------------------------------------------------------------------+
```

M�nga Atarister st�r inf�r valet och kvalet att eventuellt byta plattform, f�retr�delsevis till PC. Inget konstigt med detta d� ju Atari inte tillverkar nya maskiner och det finns absoluta gr�nser f�r hur mycket som kan f�rb�ttras med optimering av mjukvara.

En hel del har b�de Atari och PC/Mac hemma. Sj�lv har jag tre PC, ett Sun-system, Falcon, Atari TT, ett antal ST och STE burkar och i k�llaren ett g�ng 8-bitare. S�lde min Mac f�r ett tag sedan...

F�r att g�ra en framtida �verg�ng, eller tv�systemsanpassning, s� smidig som m�jligt kan man redan nu planera sina ink�p av h�rdvara och tillbeh�r. Dvs se till att de tillbeh�r man k�per passar s�v�l Atari som PC. De flesta av oss har v�l redan insett detta och har s�kert bra tips om vad som funkar "b�de och"?

N�r det g�ller sk�rmar �r det s�kert v�lbekant att i stort sett varje nyare SVGA sk�rm g�r bra att k�ra i ST HI (eller h�guppl�sning). Vissa sk�rmar, som NEC 3D g�r att k�ra i ST:ns alla tre uppl�sningar. Det enda som kr�vs �r en adapterkabel mellan Atarin och sk�rmen. N�r det r�r sig om �ldre sk�rmar kan det dock bli problem. De flesta �ldre sk�rmar �r fastfrekvens, vilket inneb�r att de svarar p� enbart en V- resp H-synk. Och chansen f�r att det �r just den frekvens din Atarimaskin skickar ut �r f�rsvinnande liten� Det b�r nog �nd� n�mnas att SM124 fortfarande �r ett mycket bra alternativ, som begagnad �r den dessutom mycket �verkomlig i pris. SM124 fungerar fint p� Falcon ocks�. Ett PRG fr�n Videl g�r dessutom att du f�r n�got st�rre bild med Falken.

Med modem �r det l�ttare. Det �r snarare undantag �n regel att ett modem inte fungerar p� en Atari om det fungerar p� en PC eller Mac.
Det enda man beh�ver t�nka p� �r att ha r�tt kabel mellan modem och dator. Det finns ett antal varianter p� RS232 kablar, en f�r skrivare, en f�r nollmodemanslutning, en f�r modem. Dessutom 100-tals varianter f�r specialfall. Inte nog med det, kontakterna kan variera i alla kombinationer mellan 25p D-sub, 9p D-sub, Mac rund och allt m�jligt annat. Titta p� vad du har f�r anslutning p� din maskin, p� ditt modem, och k�p l�mplig kabel d�refter. ST/STE har alltid 25p D-sub hane, medan exvis Falken har 9p D-sub hane och �ven rund Mac kontakt p� det som kallas "LAN" porten.

Ett varningens ord �r p� sin plats f�r vissa modem. Precis som med vissa skrivare (se nedan), har man gjort h�rdvarubantade versioner av modem. I dessa har en del av elektroniken i modemet ersatts med mjukvara i datorn. Problemet �r att denna mjukvara inte fungerar p� Atari.

F�r skrivare g�ller ungef�r som f�r modem. Det du absolut inte b�r k�pa �r en sk "Windows-skrivare". Denna fungerar enbart med en eller ett par versioner av Windows. Nu n�r W98 v�l b�rjat spridas kommer m�nga uppt�cka att deras windowsskrivare inte vill fungera med nya W98. �nd� �r W98 och W95 n�stan likadana. �nnu v�rre �r det om man ska k�ra en windowsskrivare fr�n Linux p� PC. Ett bra tips �r att k�pa volymmodeller fr�n v�lk�nda m�rken. HP har fungerat bra f�r min del.

M�ss, ack ja! H�r kan jag bara rekommendera att f�rs�ka k�ra en vanlig seriell PC-mus p� serieporten meddelst en drivrutin som heter MOUSE25. Programmet l�ter dig koppla in en seriemus p� valfri serieport om du har flera. F�r den som m�ste k�ra p� musporten �r kanske l�sningen en adapter fr�n PC-mus till Atari. Bl.a. Mario Beocroft p� Nya Zeeland s�ljer s�dana. I Sverige s�ljer Daggskimmer dessa, adressen �r:

fc3@come.to

Bengt Adolfsson i Norrk�ping brukar annars ha atarim�ss till salu. Skriv en rad till:

satyricon66@hotmail.com

Bengt kan f�rmodligen ocks� s�lja dig en massa annat kul f�r Atari, sk�rmar, laserskrivare etc.

Diskdrivar. Om man �nd� m�ste k�pa ny diskdrive kan man ju passa p� och k�pa en modell som �r 1.44Mb-v�nlig p� Atarin, exvis TEAC 235, eller Sony MFP 520. I princip ska vilken som helst fungera, men d� bara i ett l�st l�ge. Antingen 720Kb eller 1.44Kb hela tiden.

Minne. En STE anv�nder samma typ av 1Mb SIMMar som vilken PC eller Mac som helst, utom att de flesta PC och Mac maskiner fr�ng�tt 30-pinnars varianten. Det positiva �r att dessa 30-pinnare droppat ordentligt i pris. Ingen STE ska beh�va g� p� mindre �n 4Mb.

H�rddisk. H�r finns tv� skolor, SCSI och IDE. P� en Falk funkar det med b�da, p� en TT enbart med SCSI. P� en ST/STE funkar ingen om man inte k�per ett interface f�r respektive. Vad ska man d� satsa p�? SCSI �r b�ttre, IDE �r billigare. F�r SCSI finns standarder f�r separata l�dor, f�r IDE �r ingen extern anslutning p�t�nkt. IDE autobootar bara med minst TOS 2.06, SCSI med alla TOS:ar. Tycker nog man b�r satsa p� SCSI, det �r trots allt minst kr�ngel med dessa. SCSI g�r dessutom att anv�nda p� s�v�l Mac som PC som Atari.

CD-spelare. Samma argument som ovan. Med till�gget att en CD-spelare alltid M�STE ha egna drivrutiner. �ven om den delar port med en h�rddisk s� �r CD:n ett eget system som kr�ver att man "pratar" med den p� dess eget s�tt. F�r Atari finns n�gra varianter, exvis CD-Driver. Om du redan har IDE gr�nssnitt p� din maskin kan du lika g�rna skaffa en IDE-CD, dessa finns �verallt och �r mycket billiga.

Internetabonnemang. H�r ska det inte spela n�gon roll vad man har, men surfing med BIP:s abonnemang fungerar bara p� PC med Internet Explorer (epost och Usenet funkar dock utan problem). I �vrigt ska det g� bra med vilket abonnemang som helst. Observera de m�jliheter till gratisabonnemang som jag n�mnt i min artikel i AtariMagasinet! Det verkar som om SBBS2 �ntligen f�tt ordning p� sina grejer efter �rsskiftet. D�remot verkar Utfors ha f�rh�vt sig med gratiserbjudandet till G�teborgs alla hush�ll. M�nga klagar p� att de inte kommer fram och att de blir avklippta n�r de redan �r inne. M�rkligt nog tycks det inte finnas n�gon nntp-server hos Utfors? Vill man l�sa Usenets diskussionsareor b�r man nog v�lja annat abonnemang. Det finns gott om gratisabonnemang nuf�rtiden, spana in nedanst�ende tex.

http://www.netlink.se/startpaket

Mjukvara. Application Systems Heidelberg till�ter "crossgrade" f�r de flesta av sina program. Har du exvis MagiC f�r Atari beh�ver du inte betala fullpris f�r MagiC f�r PC eller Mac. Bra att veta innan man rusar �stad f�r att k�pa alla program man l�rt sig anv�nda p� sin Atari. Annars finns enormt mycket mjukvara p� olika FTP sajter. Detta kan vara mjukvara som varit kommersiell tidigare men nu sl�ppts fritt. Mera om detta i kommande AP.

```
+-----------------------------------------------------------------+
|              __          __      __  __  __         _           |
|        ___  /_/ /\/ /\/ / / /\/ /_  /_  /_/ / /\/ /_ ___        |
|            / / / / / / /_/ / / __/ /_  / \ / / / /_/           |
|                                                                 |
+-----------------------------------------------------------------+
```

L�sare och firmor �r v�lkomna att annonsera i AtariPosten. Idealet �r att samtliga annonser ska vara gratis, �ven de kommersiella. Atari-kommersiellt �r ju inte s� j�ttekommersiellt �nd�... N�r det g�ller produkter och tj�nster som �r av allm�n datakarakt�r eller inte har med Atari att g�ra kommer annonserna avgiftsbel�ggas eller refuseras.

En annons som "S�nkt pris p� laserskrivare!" fr�n n�gon datafirma kommer avgiftsbel�ggas. En annons som "Naturmedlet Kan-Jang f�rb�ttrar din prestationsf�rm�ga!" kommer refuseras.

Ett litet tips till den som vill s�lja ett ST/STE system. Vill du f� ut s� mycket som m�jligt f�r dina grejer �r det b�sta att s�tta ihop ett paket f�r musiker. Sequencer-mjukvara, syntheditorer, notutskrift kan vara med. Annonsera med lapp i musikaff�r eller musiktidskrift. Ataris hantering av MIDI �r fortfarande oslagbar, dessutom blir det billigare �n med PC. Monokrommonitor �r definitivt att rekommendera. Har du ingen egen kan du peka kunden till AtariPostens annonsavdelning!

Rent allm�nt �r det s� att ju mera specialiserade uppgifter din dator kan l�sa, desto mera pengar kan du hoppas f� f�r den. Men det �r d� ocks� sv�rare att hitta r�tt k�pare till den...

Priserna i de st�rre st�derna �r oftare l�gre �n p� landsbygden. Kan vara id� att f�rs�ka s�lja i n�gon mindre ort? Passa p� n�r du bes�ker sl�kten...

F�rs�k att alltid skriva ett pris f�r det du s�ljer. S� slipper du alla svar fr�n de som inte ens �r i n�rheten av vad du �nskar dig.
T�nk p� att priser p� begagnade dataprylar, och d� speciellt udda system som Atari inte �r n�got att bli rik p� (tyv�rr). Se det mera som en befrielse fr�n skrymmande �godelar...

```
+-----------------------------------------------------------------+
|                              _       __                         |

           +-------------------------------------------+
```

En m�jlighet att tillgodog�ra sig inneh�llet i Adobes Portable Document

Format, PDF, filer �r att konvertera dem hos Adobe via epost. Man skickar ett ebrev inneh�llandes endast URL:en d�r PDF dokumentet finns p� Internet till en "magisk" adress som pliktskyldigt omvandlar till �nskat format och skickar tillbaks till adressen som den fick jobbet ifr�n.

Man kan v�lja mellan HTML och ASCII. Vill man ha sin .PDF fil tillbaka som HTML �r adressen:

pdf2html@adobe.com

Och vill man ha den i vanligt textformat (ASCII), skriver man till:

pdf2txt@adobe.com

Inget ska st� i �mnesraden (Subject). Meddelandet ska endast best� av en URL adress. Kanh�nda fungerar det att skriva in flera efter varandra, men jag har inte provat. Om du �r sugen p� att testa direkt kan du skicka f�ljande URL:

http://ulfnilson.bahnhof.se/pdf/ulfnilson_sverige_sluten_anstalt.pdf

Detta �r en hel bok som journalisten Ulf Nilsson skrivit om Sverige. I ASCII format �r boken 732Kb. Bilder blir helt enkelt bortklippta.

Om samh�llsdebatt inte �r din kopp t� kan du hitta massor av andra PDF filer p� n�tet.

F�r den som �r road av att sticka ut hakan kan det kanske vara kul att testa om Adobe �ven varit sn�lla nog att fixa RTF omvandling? Det �r ju inte sv�rt att lista ut hur adressen borde vara i s� fall...

```
+--------------------------------------------+
|  -Att l�sa PDF-filer p� Atari, variant 2- |
+--------------------------------------------+
```

Med Ghostscript 5.10 kan du l�sa PDF-filerna direkt p� din Atari. Enligt uppgift ska detta paket finnas f�r nedladdning fr�n Straight BBS i G�teborg. Det finns �ven en FTP sajt att h�mta ifr�n:

ftp.rz.tu-harburg.de/pub/software/systems/atari/gnu/ghostscript/gemgs

Observera att det finns tv� versioner, en f�r ST, en f�r TT. Den sistn�mnda ska �ven anv�ndas p� Falkar och andra 68030 maskiner. Programmet �r p� tyska, det finns en fransk resursfil i samma mapp. Vill man ha engelsk resursfil och lite DOC:s kan man g� till:

http://www.cix.co.uk/~derryck/software.htm

"English Documentation and RSC file for Ghostscript 5.10"
(The Cheshunt Computer Club for Atari owners)

Samma g�r �ven att h�mta fr�n denna tyska hemsida:

http://www.tu-harburg.de/~smcf1605/

Det �r egentligen l�nkar till ftp-sajten ovan och Derryck Crokers hemsida f�r engelska RSC och DOC filer.

Jag lyckades mycket b�ttre via FTP sajten direkt, det verkade dock vara h�gtrafik s� det gick r�tt l�ngsamt!

Som en service till de l�sare som vill ha ovanst�ende paket p� diskett kan jag skicka det kompletta paketet mot en avgift p� 100:-
Erbjudandet g�ller bara upp till en m�nad efter detta nyhetsbrevs publicerande. S�tt in beloppet p� pg konto

417 10 48 - 4   Martin Graiter

och ange vad det �r du vill ha. Gl�m inte namn och adress!
Till de som tycker att det �r dyrt med 100:- vill jag bara s�ga att jag skulle vilja ta 500:- f�r besv�ret. Det �r j�ttetrist att s�tta ihop disketter �t folk, speciellt n�r man vet att det finns andra s�tt att f� hem motsvarande program. Allts�, gott folk, p� med modemen och tanka hem f�r glatta livet!

Med lite tur kommer Ghostscript finnas i SAK:s PD bibliotek i framtiden.

Om Falkar och sk�rmar

Artikeln om hur man bygger en RGB-koppling mellan Atari ST/STE och en TV med SCART-anslutning i f�rra numret (av AM) gav upphov till f�rfr�gningar om hur man g�r motsvarande med en Falcon.

H�r beskrivs n�gra l�sningar p� anslutningsproblem mellan en F030 och olika monitorer.

Falkens videoport �r en 19-polig D-sub hane och kr�ver f�ljdriktigt en motsvarande hona p� kabeln. De signaler som �r v�sentliga �r utskrivna i skissen:

```
     1   2   3   4   5               9   10
     R   G   B  MV   J               A   J
   +---------------------------------------+
   | O   O   O   O   O   O   O   O   O   O |
    \                                     /
     \ O   O   O   O   O   O   O   O   O /
      +---------------------------------+
       J  Cs  Hs  Vs          +12V  M1 M0
      11  12  13  14           17   18 19
```

R = R�d
G = Gr�n
B = Bl�
MV = Monochrome Video
J = Jord
A = Audio
Cs = Composite Sync/Composite Video
Hs = Horizontal Sync
Vs = Vertikal Sync

Observera att skissen i Falconmanualen �r felaktig vad g�ller numrering. Ovanst�ende �r korrekt. Anv�nd skissen h�r som mall f�r vad som ska l�das p� vilken pin, den visar l�dsidan p� kontakten i kabeln (19-polig D-sub hona). �r du os�ker s� st�r siffermarkeringar i sj�lva plasten mellan h�len.

Signalerna M0 och M1 �r kodningar som talar om f�r datorn vilken typ av sk�rm man kopplat till. B�da �r i utg�ngsl�get h�ga (ettor) och m�ste jordas f�r att bli l�ga (nollor).
De olika m�jliheterna ses i tabellen nedan:

M1	M0		
0	0	ST Mono	(SM 124, SM125�)
0	1	ST Color	(SCC1224 m.fl)
1	0	VGA	(Diverse VGA-sk�rmar)
1	1	TV	(TV via SCART)

Falcon till TV-SCART (alt. 1)

En kabel som kan fungera som n�dl�sning f�r den VGA-l�se, f�r den som bes�ker en annan Falcon-�gare och inte vill sl�pa med sig sk�rm, eller f�r den som helt enkelt vill anv�nda de uppl�sningar som TV:n erbjuder. Om du har sett n�gon annan beskrivning s� beh�ver den inte vara fel. Det g�r att koppla p� flera olika vis till SCART:en!

SCART-kontakten har ett eget, unikt utseende. Nedan visas l�dsidan p� kabelns hane med de signaler som �r viktiga f�r v�ra syften. Det �r s�llan samtliga signaler anv�nds p� en SCART, olika beh�vs f�r olika syften.

```
  CV   J VBL   J         +12V  A   J
  20  18  16  14  12  10   8   6   4   2
+------------------------------------------+
| []  []  []  []  []  []  []  []  []  []   |
 \                                         |
  \                                        |
   |[]  []  []  []  []  []  []  []  []  [] |
   +---------------------------------------+
    19  17  15  13  11   9   7   5   3   1
         J   R   J   G   J   B   J
```

 CV = Composite Video
VBL = Vertical Blanking

F�ljande material beh�vs f�r att bygga denna kabel:

19-polig D-sub hona (f�r kabelmontage), med k�pa.
SCART-hane, f�r kabelmontage och l�dning.
Kabel, 8 ledningar, liten ledningsdiameter, 2-10m (efter behov), sk�rmning ej n�dv�ndig.
2st 330-ohms motst�nd (vanliga, "kvartswatts")

Jag brukar linda ett antal varv eltejp runt kabelns �ndar, inne i k�porna. Avlastar l�dningarna fr�n p�frestningar och g�r att kabeln inte "spelar" i k�p�ppningen.

Kopplingen mellan D-sub honan i Falcon�ndan och SCART-hanen i TV �ndan ser ut s� h�r:

Falcon030   TV:ns SCART

PIN   SIGNAL   PIN

```
  1-------------- r�d --------------15
  2-------------- gr�n -------------11
  3-------------- bl� ---------------7
  5-------------- jord --------------5
 10-------------- jord --------------9
  9-------------- audio -------------6
 17-------------- +12V --------------8
      ____
 13---|R330|----H-synk ---+    +----16 VBL
      ____                *----*
 14---|R330|----V-synk ---+    +----20 C-synk
```

Synkroniseringssignalerna g�r via var sitt 330-ohms motst�nd, sammanf�rs efter motst�nden och matar sedan b�de VBL- och C-synk ing�ngarna p� SCART:en. Motst�nden l�der du l�mpligtvis direkt i den 19-poliga kontakten, s� r�cker det med en tr�d f�r vidare koppling till SCART-sidan.

Precis som p� ST-seriens koppling g�r det bra att utel�mna +12V signalen (som INTE �r belastningsbar!) och ist�llet sl� om till SCART mottagning via fj�rrkontrollen. I s� fall kan du anv�nda den �verblivna ledningen till ytterligare en jordledning:

```
Falcon030                      TV:ns SCART

11------------- jord -------------13
```

Eftersom vi kopplar till en TV ska b�de M0 och M1 vara h�ga och eftersom de ju �r det fr�n b�rjan beh�ver vi inte g�ra n�got med dem!

Falcon till Video-SCART

Den som vill kunna spela in bilder p� videon, exvis f�rtexter till f�delsedagsvideon, eller bara en helsvart sk�rm innan filmen, beh�ver en annan variant av SCART-kabel.

F�r videoinput kr�vs bara tv� signaler, tre om man vill ha med ljud. H�r kan man �ven l�ta ljudet kopplas direkt fr�n Falkens speciella ljudutg�ng.

```
Falcon030                   Video SCART

 PIN            SIGNAL            PIN

  5-------------- jord --------------5
  9-------------- audio -------------6
 12--------- komposit video --------20
```

Det finns videoAtariPostenparater som har andra anslutningar �n SCART f�r detta, men varianterna �r s� m�nga att jag helt enkelt avst�r! Jag testar alla byggen jag beskriver och det tar, som ni f�rst�r, tid. Sedan kan vi inte fylla hela utrymmet med kabelbeskrivningar heller! Dock kan jag hj�lpa till i speciellt kniviga fall. Skriv till mig i s� fall!

B�de TV och video (F030-->TV-SCART, alt. 2)

En kabel som ger s�v�l en bra RGB-bild som att det g�r att spela in p� video med den, presenteras nedan:

```
Falcon030                      TV:ns SCART

 PIN             SIGNAL            PIN

  1-------------- r�d --------------15
  2-------------- gr�n -------------11
  3-------------- bl� ---------------7
  5-------------- jord --------------5
 10-------------- jord --------------9
  9-------------- audio -------------6
 17-------------- +12V --------------8
 12------------- C-synk ------------20
 14------------- V-synk ------------16 VBL
```

S� varf�r inte presentera bara denna l�sning? I f�rsta hand f�r att bilden enl. alternativ 1 �r skarpare och stabilare. Vill man inte bygga tv� kablar (en f�r TV, en f�r video) kan ovanst�ende vara en bra l�sning.

Falcon till Commodore 1084S

F�ljande material beh�vs:

19-polig D-sub hona, f�r kabelmontage, med k�pa.
9-polig D-sub hane, f�r kabelmontage, med k�pa.
Kabel, 8 ledningar, liten ledningsdiameter, 2-10m (efter behov), sk�rmning ej n�dv�ndig.

Commodore 1084S har en 9-polig D-sub hona i chassit med f�ljande pinout:

```
     B   G   R   J   J
     5   4   3   2   1
   +-------------------+           NC = Not Connected
   | O   O   O   O   O |
    \                 /
     \ O   O   O   O /
      +-------------+
        9   8   7   6
        Vs  Hs  NC  NC
```

Dessutom finns separata ing�ngar f�r V�nster och H�ger ljudkanal i chassit. F�rslagsvis bygger man en kabel fr�n Falkens audioutg�ng till sk�rmens audioing�ngar. I s� fall skippar man kopplingen till separat audioing�ng i skissen nedan.

Vill man ansluta sin Falcon till en Commodore 1084S RGB-sk�rm s� kopplar man p� f�ljande vis:

```
Falcon030                        1084S

 PIN             SIGNAL            PIN

  1-------------- r�d ---------------3
  2-------------- gr�n --------------4
  3-------------- bl� ---------------5
  5-------------- jord --------------2
 11-------------- jord --------------1
 13------------- H-sync -------------8
 14------------- V-sync -------------9

  9-------------- audio ------------------- separat audioing�ng
 10-------------- jord ------------ jord p� separat audioing�ng

 10--jord--+
           |
 18---M1---+
```

Det verkar inte spela n�gon roll om man kodar denna sk�rm som TV eller som "ST-Color". Allts� beh�ver du inte g�ra f�rbindelse mellan p10 och p18 p� Falconsidan.

Om du �nd� inte f�r n�gon bild kan du b�rja trycka p� omst�llningsknAtariPostenparna p� baksidan av sk�rmen. Sk�rmen kan ju ta en massa olika signaler och dessutom via olika kontakter!

Falcon till VGA

�r det fortfarande n�gon falk�gare som inte skaffat denna adapter �n? F�r fullst�ndighetens skull tar vi med den ocks�. I VGA-�ndan har vi en 15-polig, hi-density, D-sub hona. Passa p� att skaffa ocks� de sexkantiga inskruvningsbitarna som monitorhannens skruvar passar i. Fysiskt kan adaptern realiseras genom att byggas in k�pan f�r den 19-poliga D-sub honan. I �ndan d�r kabeln ska komma ut f�rstorar man h�let s� att den 15-poliga kontakten f�r plats. S� f�r man en n�tt liten adapter. Fast enklare �r att helt enkelt ha 20cm kabel mellan kontakterna!

Signalerna p� l�dsidan av D-sub honan:

```
       R  G  B     J
       1  2  3  4  5
   +--------------------+          6,7,8 = Jord
   |   o  o  o  o  o    |
  6 \ o  o  o  o  o   / 10
     \ o  o  o  o  o /
      +--------------+
      11 12 13 14 15
            Hs Vs MV
```

Sk�rmad kabel b�r anv�ndas, sk�rmningen ska jordas bara i ena �ndan! Det �r ocks� n�dv�ndigt att verkligen ansluta p5,6,7,8 till jord. Eftersom vi r�r oss med h�gre frekvenser p� VGA, blir det ocks� l�ttare st�rningar!

Kopplingen ska se ut s� h�r:

```
Falcon030                          VGA

 PIN             SIGNAL            PIN

  1-------------- r�d ---------------1
  2-------------- gr�n --------------2
  3-------------- bl� ---------------3
  4----------- monochrome ----------15
  5-------------- jord --------------5
 11-------------- jord ----------6,7,8
 13------------- H-sync ------------13
 14------------- V-sync ------------14

 10--jord--+
           |
 19---M0---+
```

T�nk p� att �ldre VGA-sk�rmar inte alltid t�l att "bl�sas upp" med program som �kar uppl�sningen. Du kan faktiskt f�rst�ra din sk�rm! Nyare SVGA-sk�rmar t�l mycket, men inte vad som helst. Ser du att det flimrar s� st�ng av och prova med andra inst�llningar.

Falcon till SM124 och SC1224

Om du vill anv�nda dina gamla originalsk�rmar, SM och SC fr�n Atari, samt om du redan har en adapter fr�n ST-seriens 13-poliga kontakt till andra varianter av monitorer, s� kan nedanst�ende adapter vara r�tt v�g fr�n sk�rm till dator.

Den 13-poliga DIN kontakten �r densamma som i ST-seriens monitorkontakt i datorchassit, fast f�r kabelmontage.

```
Falcon030                      13p DIN hona

 PIN             SIGNAL            PIN

  1-------------- r�d ---------------7
  2-------------- gr�n --------------6
  3-------------- bl� --------------10
  4-------- monochrome video -------11
  5-------------- jord -------------13
  9------------- audio --------------1
 13------------- H-sync -------------9
 14------------- V-sync ------------12
 17-------------- +12V --------------8
 19---M0------(mono detect)---jord---4

 10--jord--+
           |
 18---M1---+
```

H�r kr�vs fler ledningar �n i de andra exemplen, men det g�r bra att g�ra specifika adaptrar f�r varje sk�rm, exvis f�r endast SM124:an. I s� fall skippar man ju R,G,B-signalerna och +12V. Det �vriga kvarst�r. Vill man bara anv�nda SC1224:an beh�ver man inte +12V, "monochrome detect" och "monochrome video".

Samtliga komponenter kan k�pas i v�lsorterade elektronikaff�rer.
Den som inte vill bygga sj�lv kan best�lla kablarna fr�n mig.
S�tt in 250:- per kabel p� mitt postgirokonto:

417 10 48 - 4   Martin Graiter

Ange vilken av ovanst�ende kablar du vill ha, samt l�ngd i meter. Har du andra sk�rmar �n de n�mnda kan du f�rst skriva ett ebrev f�r att utr�na huruvida anslutning till ST eller Falcon �verhuvudtaget �r m�jlig.

```

>   A - what kind of disks it uses

Double sided double density (DSDD) 3.5" disks. 720K

>   B - where I can get said disks

Some shops still carry them. If you can't find any, just get some HD disks and stick a piece of tape over the HD hole. This makes them less reliable, but it often works.

>   C - If and how I can run a system diagnostic

Get sysinfo.prg from the quick FAQ.
If it was never modified, it has 1 Mb of RAM and no hard disk.

>   D - Where I can get applications, etc

From just about any FTP site.

>   E - Where I can get a compiler (BASIC or C preferable, PASCAL if
>necessary)
>

Same as D.

>Id really like to sstart using it again. Ive decided to take on the
>ambitions goal of writing a program to make it communicate over some
>port or other with a PC running Linux. I can write the software If I
>get a compiler and learn the system basics I think, but I have no

Some bus error... You didn't do the 4" drop with the machines switched on, did you ?

>Are the power supplies in the "e" and "f" model compatible?
>

Yup!

>Are the two socketed chips on the Ste's the TOS ROM's?

There are several socketed chip on the STE, the ROMS are 2 28pin chips with Atari written on them, just under the floppy drive. TOS 2.06 chips are 32 pin chips.

>Are the 6? socketed chips under the power supply on the STf's the 1985
>copyright TOS ROM's?

Yup.

>
>I have swapped parts around and have found that of 7 computers, 4 have bad

Depends on the drive. Trial and error I'm afraid...

>
>Most posters seem to live in Europe. Does anyone have any information or
>"theories" on why the ST seems to have been more popular in Europe than in

Marketing?

I also think that the PC craze caught on in the US first, squashing competition from the start. Don't ask me why.

Even in Europe, each national market was pretty different. In Germany it was a very pro market, the ST was mostly competing with the Mac. That's why most of the serious software nowadays still comes from Germany. In the rest of Europe, it was mostly marketed as a games/hobby machine, more like the Amiga and Amstrad at the same time.

Alternately I can sell you one ready built with installation instructions (if you thin k you can build one yourself you can definitely install this one) for 55 UKP plus P+P (I guess another 5 UKP) and that includes the big socket to fit over the processor......this is assuming that you have an STFM or an STF..... this comes with TOS2.06 (non-switchable though) which you don't have to fit but if you d o t he disk auto-boots...if y ou don 't you have to run AHDI (possibly CBHD, HD-DRiver etc) from a floppy...This is the Mario Becroft u nit and I have n ever fitted such a hassle free upgrade to an Atari.....it's almost as easy as fitting a switchable   TOS upgrade.....sodler a s ocket over your processor, plug interface in, solder on one wire to HD port pin easy to get at), and optionally take out your tos chips and plug in one wire to where they were to activate the TOS2.06....no cutting, no de-soldering components, easier than a Nemesis.......YOU NEED AN STFM OR STF though...

Anybody got any software or info to allow the MEGA STE to connect/interwork with a PC via the LAN port e.g. cat5 cable or a hub.

I don't mind if its only TCP/IP (can STiK use that port) or whether BITz ever got Ghostlnk to work over the LAN port.

Any info much appreciated

:   A couple of my ST's have a pin-striped screen. I saw no mention of
this
:problem in the Quick-FAQ. What causes this and what should I do to try
to
:repair them?

Seems the memory is bad. If your memory is socketed try
yanking out the SIMMs and reseat them.
A good vacuum cleaning is beneficiary too. Dust and hair
can sometimes lead to electrostatic disturbances.

:I tried the "four-inch drop" on one of the computers and it had two
bombs
:come up on the screen. What is that?

You shouldn't bang your machine like that.

:Are the two socketed chips on the Ste's the TOS ROM's?

HI and LO, yes they are.

:Are the 6? socketed chips under the power supply on the STf's the 1985
:copyright TOS ROM's?

They are.

:Most posters seem to live in Europe. Does anyone have any information
or
:"theories" on why the ST seems to have been more popular in Europe than
in
:the USA?

Maybe because computers are cheaper in the US? and people seem to
have more money. The ST was the choice of those who couldn't
afford a Mac or an Amiga.

Many German students took the ST seriously and bought it with a
b/w screen, to be able to write their schoolwork on it.

No, that's ok. Works fine. (Includes 2.5" IDE) (Also 3.5" devices with smal power)

>I suppose that I'll put the original 4Mb back in as I doubt that I'll
>need that much "STRAM", I could then sell the 16Mb SIMM to recoup some of
>the cost of my upgrades.

I whitch way you want, also you can use the 14MB ST-RAM, no problem.
Some other RAM boards makes trouble, use the original boards..

(Colorised vertical stripes in 256 color mode = 100% ST-RAM mismatch)

If it's a 520, and it hasn't been tampered with, then it's 512Kb. To be sure, use sysinfo.prg, downloadable from the Quick FAQ.

If any of it wasn't working, the machine would probably not boot up, and just about any software would crash.

Sounds like a good idea, a "Autofolder FAQ" would be useful, especially for newbies to alternate OSes like MagiC, MiNT and Geneva.

Here's a couple of things I know (doesn't) work. It's mostly MiNT-related, 'cause this is the system I know best:

* The various screen-enhancers for the Falcon must run after MiNT. This applies to all I've tried, including Screenblaster II and III, BlowUp, ScreenWonder and Videlity. Running them before MiNT results in anything from subtle bugs to total crashes. Btw. SB3 does not work if you're using init.prg from K[GE]MD.

* HS-Modem must run *before* MiNT. This is very important, as MiNT will support it directly if present. This means that if you run HS-Modem after MiNT, MiNT's serial-devices will use the old (and buggy) BIOS-routines and not the enhanced drivers. Running HS-Modem after MiNT will work, but only if you *never* use MiNT's serial-devices!

* Due to the way STiNG does it's internal scheduling it *must* run after MiNT.

* MiNT is a GEMDOS-replacement, and must therefore run after any programs that provides extensions to BIOS, XBIOS or GEMDOS. Basically this means that MiNT should execute as late as possible, only a handful of programs needs to run after it (look above). There are some very good reasons for running MiNT as late as possible, so please follow this advice!

* Graphics-cards and NVDI: The graphics-card driver must run before NVDI, and generally you have to disable NVDI's own screen-drivers (they're usually in c:\gemsys, just rename them). Btw. there is a program on my web-site (www-atari.nvg.ntnu.no/software.html) that does this automatically if you have a Nova card.

* Afterburner: The TK-driver must run before anything else, the only exception is your boot-manager. Also, 68882.prg must run after MiNT.

* XBoot: If you run XBoot on a cached filesystem it will reorder your autofolder alphabetically! So if you're using TCache or something similar with a write-cache, then *never* run it before XBoot. This also means that you can not start XBoot from your desktop to select another configuration if your boot-drive is cached.

OK, I'm supposed to be working so I'd better finish here ;-)

thanks, but according to the few ICs (besides the GAL) on that little board
that's a bit too much - anyways, i could have got it here for about 35UKP new.

> socket to fit over the processor......this is assuming that you have
> an STFM or an STF..... this comes with TOS2.06 (non-switchable though)

i've a 1040STF in which i patched a TOS 2.06 into it.

just have to get hold of a GAL-burner (; thank you

AFAIK it doesn't support IDE, it access the SCSI-device directly for
maximum speed.

Hi

I'm desperately after a monitor switch box, the one that has the 2
monitor inputs as opposed to the multisync switch box.

I'm looking at around a fiver or I'm willing to swap some software or
whatever for it.

This is urgent as I can't test any software on a colour monitor without
it, the joys of having an ST in a tower case:(

The cable is a straight 1:1 cable with 19-pin male D-SUB connectors on both
ends - you can easily make one, however, you should keep it short (about
20cm is safe) and use good, shielded cable.

You haven't knocked the ID switch have you? Is it meant to
be on 0 and you've knocked it onto id 1.

>If I boot without the hard drive on - it says:
>"No ICD host adapter detected" - so I guess the Link2 is sort of working..
>Any ideas from this??

The hard drive provides the terminator power probably so
when its not on the link wouldn't be seen as its not fully
powered up..

If its been moved perhaps a cable has worked loose. You
could look at the connectors and check the cable itself for
damage. Perhaps a can of switch cleaner might help to. To
clean up the connectors.

Newsgroups: comp.sys.atari.st.tech

Last Thursday my TT suddenly effectively expired. After switching on it will operate for between 30 to 90 seconds before crashing, sometimes showing 2, 3 or 4 bombs but more usually 24.

When the TT operates long enough for the memory test to complete, memory seems to be ok. The fault is still present even when I remove TT ram, the 2 mb ST ram daughter board (leaving only the 2mb on the main board), the hard drive and even the floppy. That is, it crashes even with a bare, windowless and almost iconless desktop.

Things I have eliminated :-

Keyboard and mouse - those from my MSTe make no difference.

The Ajax chip - again the one from the MSTe makes no difference.

TOS roms - I have two sets, US and UK. They make no difference.

The only definite symptom the computer had exhibited before it died was a tendency when it had been switched on for a while, to set bit 3 on the first byte of a file written to a floppy, and, in longer files, the same bit in other occasional bytes. I can't say whether those bytes were at regular intervals - they may have been. For those with a macabre sense of humour, it delighted in changing the first three bytes of a Papyrus file from PAP to XAP.

I have once or twice observed the same phenomenon with a file written to a Supradrive FD-10 on the ASCI bus, but never to a hard drive on the SCSI bus.

Recently I have had a good deal of sport involving Magic 6 and HD Driver. I had solved all those problems, bar one, when the machine died, so I doubt that they are relevant, but cannot rule out the possibility.

Has anyone met anything like this? Does anybody have any suggestions?

It sounds to me like a store fault, David. You have eliminated all but the 2Mb. It COULD be this but there is also all the store access (MMU) logic.

I have known store failure and bit-errors when the power supply has been faulty. Check that there is a GOOD earth for the RAM, that the decoupling capacitor on the 5v RAM supply is not faulty and put a meter on the PSU 5v and also on the 5v line close to the RAM. You may find it drops when the failure occurs in which case the prob. will be fairly simple to fix.

Hi Folks,
I've heard that it is a fairly easy thing in terms of the connections all being available on the expansion port, of adding TT-RAM to a Falcon...is this true, if so, which pins do I need for what?....If someone can give me the info (or point me at an URL, it doens't appear to be on DOITF030 BTW or the hack page) I might well get a batch made, as I have found a place that does a very reasonable deal on prototyping quantities of PCB's without the usual artwork generation hassles...
      I want this as most of the progs i use willauto-recognise the TT-RAM and use it, Scooter, CAB etc...

Not sure about (a) or (b), but you'll get a much better picture on
a TV by making a cable to connect the RGB signals from the monitor
port to your TV's SCART socket.
(d): A genlock is a device for mixing video output with computer
generated graphics, so you can create titles for videos basically.
Sounds expensive and not really the best way to go.
I would try (c) - probably the cheapest method anyway!
Gary.

You need the Bridge Module - a commercial plugin that allows you to
output files in various different formats.

Regards,

can anyone give me specific details of the disk format of the ST?

My main question is regarding the two R/W heads. is the sector format numbering scheme go from sector 0 to sector X on the "top" side, and start at X+1 on the "bottom side"?

Any help would be appreciated.

Tony

---------------------------IN ENGLISH------------------------------

Well, since a surprisingly great number of non-Swedes decided to subscribe to this swedish publication, we feel obliged to at least present the subscription information in english.

To subscribe to AtariPosten you just need to send an email to:

Atari_Posten@bigfoot.com

Only the word "Subscribe" should be in the body of the message, no subject is needed. Should you decide you'd like to unsubscribe to AtariPosten then send a message to the same address, but with the word "Unsubscribe" in the message body instead. If you'd like to receive previous issues of AtariPosten, you just write the word "Subscribe" and the number of the issue directly behind.

Since there are only two days since issue number zero came out, that is the only issue you can get by now. For AtariPosten 0 you should write "Subscribe0".

Advertising

All Atari-related advertizing is free in AtariPosten, even the commercial one. General computer advertizing can be accepted but will have to be payed for. Advertizing about other matters will not be accepted at all. All ads can be cut or edited or refused for any reason the editor deems fit. Long pricelists will be refused, links to sites and email addresses will be accepted.

Hi!
I was messing with my NVRAM settings, using Falcon030 NVRAM
by R. Kurz.

Somehow, someway, now, I am unable to go to the set video
and change the settings for my desktop-more or less colors, or
the ST compat modes. When I do, the desktop resets and such, as
before, but as soon as I move the mouse, I get bombs.

I seem to be stuck at 16 colors, 80 columns.(VGA)
Though the system will also boot up in RGB mode for my
1CM135 Monitor!

HELP!!!!!!!!!

Vector graphics exported as EPS from Bridge always worked well from my experience. On the other hand, attempts to dump a complete Calamus page to a PS-equipped printer always failed, notably because of positioning problems with certain frame types.

There's a very expensive PostScript module available for Calamus, one that I tried in beta form a few years ago. I'm not sure how it's progressed since then but it did support PS-level-2 and was quite fast. DMC used to sell a standalone EPS to CVG converter -- great for converting color EPS clipart to CVG 1.1 format.

Unless something has changed in the recent Calamus update, or the price of that expensive module (not Bridge) has come down, outputting a complete PostScript page was a royal pain (this is where PageStream's strengths were). The workaround was to export from Bridge using bits and pieces (through TIFF and EPS) and then re-assembling the parts in a PS-friendly page-layout program like PageMaker (the destination printer, a DocuTech, had a PostScript frontend).

Lack of good PostScript support really hurt Calamus in some ways, although the whole concept of the program, ironically, was to circumvent PostScript's limitations.

Use BOOTKONF.PRG from Uwe Seimet, best what i ever see'n
Kick other..

Switch OFF, connect SM124, switch on. Display/NVRAM must be reset
to default (monochrome) settings. (Also if you insert testkit into rom port)
Sometime other setup programs wrot trash into NVRAM.

SWITCH OFF BEFORE INSERT ANYTHING!!

Listed at 133UKP which isn't bad.

>Otherway, replace 2.5" with a 3.5" device, it's cheaper as any 2.5" device..
>Same speed, more space for the same money.

How could I fit a 3.5" drive in the Falcon? If I put it into the Desktopper
I think that I would need to extend the cable, which I think is a bad idea.

>(Need's 2.5" to 3.5" IDE cable adaptor & PSU connect!)

Yes, I've read up on the adaptor in Doitf030, but I would buy one readymade.

>(2.5" devices takes only +5V thru the flat wire, 3.5" devices can't do that)

I'm afraid for my PSU! :-)

>You can use your old devices well, but remeber what i sayed last time..

Yes, you said that ATA4 devices would be OK with HDDriver and MagiC (6), but
that older interfaces weren't guaranteed to work if I read you right.

>If you use SCSI, same as before. SCSI logic is on falcons mainboard, use the
>same bloody smal DMA/SCSI interface as before. It's a bit faster, but remember
>the 1800KB/Sec DMA barrier from Atari..

Understood. Thanks again for the help!

I've got the replacement for R216 now - one 10R plus 24 spare in case I sneeze! ;-))

HI people!!

I just got anNTSC (US) Falcon which unfortunately has NTSC RF out
instead of PAl, what makes me very miserable...
Is there any chance to get PAL signal, or:

a) can the NTSC encoder be replaced by the PAL encoder on motherboard?
b) is there a device /external probably/ which can turn the NTSC signal
from RF out back to PAL signal?
c) can I use monitor out to get the signal? Meaning, connect the
Falcon to scart on TV or record to the video?
d) do I have to use genlock then (whatz genlock, anyway??)

please help and answer to the above address...

sasha

Still trying to sell the TT system. I have an offer, but this system is easily worth $500.

TT system: $500

TT030 10/16
48 MHz CaTTamaran
Nova ET4000 1 meg card w/ v2.08 drivers (fitted inside TT, up to 800X600X32K) 40 MHz FPU (Motorola never supported over 32 MHz officially in PLCC, but my distributor got one from Motorola that was tested to 40, which I needed to get the CaTT stable)
TOS 3.06

HD floppy
External Quantum 340 LPS drive

You can't put a hard drive in the TT case because the stock power supply can't handle the accelerator, RAM, Nova, and a hard drive. The back of the case isn't perfect (the fan slots have been opened to a hole to increase air flow and the video card mount is functional, but not perfectly clean).

Calamus SL98, ExtenDOS Pro 2.4b, NVDI 4.11, ScanX, Outline Art, Stalker 3, and much more software would go with the system.

The last news about the PHENIX 040/060

At the end of December, at the very time when the E15 version of the PHENIX motherboard was ready to be produced for the developers, CENTEK decided to bring some important changes about the hardware architecture of this motherboard.
Here is the list of the major changes introducing the R1 (Rev.1) version of the PHENIX 040/060:

- The DSP56301 is now connected on the PCI bus.
- A card with 3 other DSP could be plugged into a PCI slot, not into a dedicated slot.
- The ULTRA-SCSI and USB (2 ports) controllers have been replaced. The new ones are connected on the PCI bus.
- Two IDE (ATA-4) connectors are now officially provided thanks to a new component on the PCI bus. Four peripherals are so possible.
- The MIDI, SERIAL & // ports are suppressed. They are possible with some USB interfaces, opening the way of the future.

- The QUICC chip is suppressed.
- The EDO RAM is replaced by the SDRAM; it is 2 times cheaper and 2 times faster (with the 060).

Why these modifications ?

The first objective was to reduce the production cost: the suppression of the QUICC and the transfert of some functionalities on the PCI bus (to reduce the programmable logic cost) follows this objective.
The reduction of the cost continues actually to equilibrate the cost of the performances increase.

The second objective was to take in count the remarks of some developers (like Soundpool) in the domain of the DSPs. They was wishing to have faster transferts between the DSPs. With the DSP on the PCI bus, the hardware architecture is optimum.

At CENTEK, we were wishing to reduce as much as possible the necessity of the CPU use to transfert the DATA. For that reason, the USCSI and USB are too on the PCI bus.

The performances ?

Imagine the heavy task that reads a movie from a DVD disk.
The hard disd drive (HDD) (Ultra-SCSI or Ultra-IDE) transferts the AUDIO and VIDEO DATA (MPEG2) to the controler (USCSI or IDE) that transferts on the PCI bus with BURST at 132 MBytes/s to one DSP56301 to uncompress (real time) the AUDIO and one (or more) other DSP to uncompress the VIDEO.
Each DSP sends the results to the final destinataries:
- the AUDIO to the 20-Bit CODEC (on motherboard) by the DSP-CODEC serial link.
- the VIDEO to the GRAPHIC card by the PCI bus at 132 MBytes/s (BURST).

Conclusion: no important CPU intervention which continues to run into the system SDRAM on the other side of the PCI-040 BUS bridge !
This is the undebatable superiority of the PCI architectured computers, not like the simple 'PCI as peripheral' architecture !
Have a look on our functional block diagram.

The final objective was to draw nearer to this total PCI architecture faster than it was previously planned to easely introduce the new future computers like the PHENIX 2 (code name). The PHENIX is now comparable with the architecture of the last generation of PC.

The choice of the new PCI components was the principal reason of a new delay
to terminate the motherboard. We now terminate the PCB routing...

Softwares update:

Cecile demo 1.91 from 01/27/1999
CENTinel demo from 07/18/1998

Hi,

Well the good news is: I got the thing to boot last night after
a 5 hour investigation. It appears that you may have been right
and it was the STe's ACSI port connector that was the culprit..
I half-suspect a dry joint or something but it seems fine now -
well time will tell anyway.
BTW anyone know why my drive never auto-boots from cold? I can
wait and wait and it still won't boot from a hard-reset - however
it'll boot from a soft-reset all the time.. %-)
I'm using tos 1.6 (or 1.06 as that's what everyone calls it now?).
Just wondered - it's not a real problem ;-)
As long as it boots from now on I'll be happy (I'm still a little
suspicious of what the problem was/is though!). Main thing is I
know the drive and Link2 are fine - maybe the DMA chip in the STe
is on it's way out..
Thanks again, anyway!

Kev

The cable is a special 19-pin ACSI made only for Atari. ICD still
makes some high-quality replacements. http://www.icd.com/

The hard-disk software is the same for any hard-disk, on Atari.
The basic one is AHDI, which you can find on most FTP sites.
A better one is the german freeware CBHD. The best one is the
commercial HD-Driver. http://www.systemsolutions.com

The on screen error message says "Floppy disk defect or Check your
connecting cables". Something like that I have a German ATARI 1040 ST fm
version.

I didn't use this machine too long. I happened to have two of them. I always used my first 520+ machine without bigger problems for many years and then I found somebody who was interested in purchasing it. So I sold it and was happy to use my 1040. The first thing I noticed was that floppy drive was much louder then my external drive with 520+. Anyway we've been playing a month o two but one day using PC-Ditto I loaded MS-DOS 6.22 and my computer crashed it was late so I just switched it off. Next day my son reported anxiously that ATARI is suddenly saying to all of our disks that they are all defect. I remember also throwing the computer carefully on the couch for cleaning on my desk. Horror story from Moscow +:O)

Now I get my desk top ok but when I'm clicking on Floppy the drive makes noise like searching for tracks you described and after a while reports that whether disk or connection were wrong.

My personal experience is that anything over 800*608 leads to unpleasant
"shimmering" of certain objects such as the desktop fill.

I have Nemesis plus Screenblaster.

Normal the falcon gives no RF-signal. In the monitor plug are
signals than are compatible to SCART.
There is no 'encoder': you have comp sync, Vsync, Hsync VBlank and
colors.

With software you cab switch between 50 and 60 Hz just as in the old
ST's.

Really? I use 1204x656 every day, and I never get that. I'm

guessing it's probably your monitor (interlaced?) or perhaps a weak
power supply or something. (My screen quality improved quite a bit
when I replaced my power supply.)

Not really. The PC joystick port is for an analogue joystick and the Atari mouse/joystick port is for a digital joystick. The analogue joystick typically uses two potentiometer slides, one for left movement, one for right. The joystick port applies 5 volts to the potentiometers and the return voltage is sampled to determine the position of the stick. The digital joystick uses four switches - left, right , up and down.

I did design an interface to us a PC joystick on an Atari about a year ago using a quad comparitor but never got around to actually making it.

Get the data sheet for the RGB encoder. I think it is an MC1377P. It sits just behind the modulator. The data sheet will detail how to set it up for NTSC or PAL. The two main things I remember were the clock and delay line will have to be changed.

Mike

Hello. I have two 1040STf computers that have a floppy drive that has a wide button across the bottom. All my other ST computers have a narrow button to the side. Are the big button drives one-sided? The computers they are in have the 1985 copyright.

Also, if anyone knows of a site that shows some pictures of hardware for the ST, please let me know. I see the ports on the back, but I want to see a picture of what goes with them.

Thank you,
Jason Whorton

Hi

The small buttons are usually double sided drive; the ones with a
largish button are usually single sided.

However, Atari did fit some double sided drives with a large central
button. I have only seen these on STF's!!!!!!

The best way, other than remove the drives, to find out what they are
and that is to format them or see if they can read a disk that is
formatted double sided!

--
Cheers! for now

My Mega2 ST from -87 has the big button and is double sided.

If you can find/make an adaptor to go between the Atari joystick connector and PC joystick port then it should work. There are plenty of digital (i.e. on/off) joysticks for the PC - they just don't give any control between zero and full movement.

Why not cut off the Atari plug and wire in a PC connector.

Steve

All 1040STF's had double sided drives. The large eject button is a feature of the very earliest ones. Only the very first 520STFs had a single sided drive. You can tell anyway by trying the desktop's format option to see what's available.

There are plenty of Atari dealers in the UK. The Upgrade Shop, Titan,
Systems Solutions all have web pages, there might be others.

Put it this way - I use 640x480 and 800x608 using Videlity on a VGA. If I simply replaced the VGA with an SVGA monitor (.25 - .28) would the screen definition be appreciably better at the same resolutions. If only I could borrow one to see...

Dan,

Your price is a bit too high. We like to add sentimental value to our Atari systems, but for a system that runs like an outdated 486 with 1991 technology, the true value is closer to $150 (especially for a system that's not in perfect shape). I had over $3,500 invested in my TT when I sold it for $200 two years ago. To put it in perspective, remember that you can spend $300 on an old, used, 486/100 and use Gemulator to buy a system that's faster than the CaTTamaran-enhanced TT.

I have another non-functioning TT, and would buy yours to replace it only if the price were around $150. That's how much Gemulator 98 Pro would cost for my PII 450 PC, which would run ten times faster than than your TT.

Thanks,
Glenn

Glenn, my friend, you are quite mad.

I have an offer for $500 in a few months, an offer for $500 from Europe
now, and an offer for $400 in the good ol' USA now. I can probably get
$150 for the video card alone.

Of course, if you actually want a tired old excuse for a '486, you might
try to soften the price a bit. Can't blame you for trying...

Regards,

Dan

The fact that you mask your email address lends _so_ much credibility to
your noise...

I'm thinking of putting the Falcon into a Desktopper case, I have one plus a
nice PSU.

Since it looks like I can't use the IDE drive that I have in my Falcon with the CT2 that I'm expecting (it isn't ATA4), I'm looking to replace it.

At the moment I only use it for offline and other caches with a SCSI as my main storage.

Would I get the best results (speed wise) from the CT2 by standardising on IDE or retaining the mixture that I'm using now? The SCSI drive is quite small at 540Mb so I wouldn't be losing too much.

:BTW anyone know why my drive never auto-boots from cold?

It could be that your harddisk needs more time to spin up?
Turn it on, wait 20-30 seconds and then turn on the
computer. If you had TOS 2.06 you'd have a delay built into
the startup sequence of the TOS.

You should definitely get an IDE. SCSI is generally superior to IDE, but not on the Falcon :-/ With the CT2's 25MHz bus IDE will be three times faster than any SCSI-drive, and since IDE is a lot cheaper than SCSI there's no reason to choose SCSI unless you're using CAF.

2.5" IDE Toshiba 2.1Gig ~~315 DM (germany) (Runs fine with CT2)
(Toshiba MAT series!) (Also you can take a bigger one)

Otherway, replace 2.5" with a 3.5" device, it's cheaper as any 2.5" device..
Same speed, more space for the same money.

(Need's 2.5" to 3.5" IDE cable adaptor & PSU connect!)
(2.5" devices takes only +5V thru the flat wire, 3.5" devices can't do that)

>At the moment I only use it for offline and other caches with a SCSI as my

You can use your old devices well, but remeber what i sayed last time..
Best speed results you have with IDE, Centek build the IDE logic on CT2 Board.
Have a look to the IDE transfer rates on there WebSite. Great!

If you use SCSI, same as before. SCSI logic is on falcons mainboard, use the
same bloody smal DMA/SCSI interface as before. It's a bit faster, but remember
the 1800KB/Sec DMA barrier from Atari..

I have an older Quantum Fireball SCSI 1Gig connected external, IDE is much faster.
Machine boot from internal IDE in 20 Sec. complete

Regards, Robert

Unless your Falcon is modified to fix SCSI (e.g. the Nemesis patch), I would definitely stick with IDE. The Falcon's SCSI is way too buggy without the fixes. I have a 2GB IDE drive and only use SCSI for occasionally getting something off of CD-ROM.

Otherwise, SCSI is probably best (though more expensive).

That might help. I was using RGB at the time, but I was amazed at
the difference in my display when I changed my Falcon's PSU. Of
course, my old PSU was *really* weak.

Hello. I have a few technical questions about the STe and STf. I have four

STe's and three STf's. Most of them have a problem or two (bad power supply, bad disk drive, keyboard has a couple of broken key switches) and am trying to make a few computers out of several.

A couple of my ST's have a pin-striped screen. I saw no mention of this problem in the Quick-FAQ. What causes this and what should I do to try to repair them?

I tried the "four-inch drop" on one of the computers and it had two bombs come up on the screen. What is that?

Are the power supplies in the "e" and "f" model compatible?

Are the two socketed chips on the Ste's the TOS ROM's?

Are the 6? socketed chips under the power supply on the STf's the 1985 copyright TOS ROM's?

I have swapped parts around and have found that of 7 computers, 4 have bad disk drives. If I find a 720K drive somewhere, will I be able swap the brown-beige face plate from the original drive to a generic PC 720K drive?

Most posters seem to live in Europe. Does anyone have any information or "theories" on why the ST seems to have been more popular in Europe than in the USA?

Thank you,
Jason Whorton

HELP!! I dragged my atari 1040F out of the garage. I know nothing about it. It boots right now to a green screnn with Floppy disk A and Floppy Disk B and Trash on it. I dont know if it has a hard drive, and I dont know what kinds of disks it uses, I dont know how much memory it has, blah blah blah. It has a mouse and a joystick and a monitor hooked to it. Does anyone know:

A - what kind of disks it uses
B - where I can get said disks
C - If and how I can run a system diagnostic
D - Where I can get applications, etc
E - Where I can get a compiler (BASIC or C preferable, PASCAL if necessary)

Id really like to sstart using it again. Ive decided to take on the ambitions goal of writing a program to make it communicate over some port or other with a PC running Linux. I can write the software If I get a compiler and learn the system basics I think, but I have no manual. The only surviving manual I have is for Mark Willams' C and I dont have the disk. Please help!!

Thanx a million,
Jon Striley

Has anyone attempted to make a list (or lists) of autoprograms in an running order which doesn't cause conflicts etc. Its hard to remember - or even find - the readme docs which say run this before that but after the other.
For example - Falcon single tos - XBoot

XBoot/Superboot/Stoop
FPatch2 (Not needed with NVDI3+?)

NVDI3
SpeedoGdos
Selectric
Drvin
MFP, SCC etc
Sting, STiK
WDialog
Videlity
FolderXX
Sam
Stikstr
Mintnp/ Geneva/Magic etc

Add more to the list..

It would be instructive to hear from Those Who Know what the correct order would be. Trial and error is all very well, but knowledgable help would of more assistance to most of us I imagine. Throw in your autos to this list and lets see if anyone is bold (and informed) enough to put it all in order...

Here's hoping

CJ

The said specs of GEMulator and the real operation of GEMulator is
another matter. I've seen some of these products and frankly the
benhmarks seem bogus when it comes yo really to using it. If
"Gemulator 98 Pro with your PII 450 PC" is that much faster then it
only crashes or misbehaves faster otherwise why replace the TT? Cause
the real thing is always better...

  The CENTurbo I&II fix the scsi bug and speed up the IDE. So after,
a good IDE go up to 9.7 MB/s in turbo mode (see our web site...).

  The poor SCSI is limited to 1.8 MB/s and can be never accelerate :-(

On Phenix, the SCSI will be a Fast scsi (20MB/s)

I don't know what you mean, pin-striped screen. However it could be your rf shielding, or lack thereof.

>
> I tried the "four-inch drop" on one of the computers and it had two bombs

I stay away from the four inch drop as it can unseat as many as it seats.
Take the cover off and press ALL the chips in tight.

This is in the faqs. Some drives, some not.

Hello,

I'm also looking for a way to connect an Atari TT to an ethernetwork with
a PC and a Mac.
Maybe there's a possibility in connecting via the serial port with a
direct cable connection,
but where to find the drivers.

Another problem related to this one is the following:
How to print from a PowerMac 8600 (200 Mhz 128 Mb RAM) using MagiCMac (TT
emulator) to an Apple stylewriter 2400. Should I have Atari drivers for
this printer. The printer is the same as the Canon BJ-4200 I thought.
Maybe there is a possibility.

Is there anyone who knows how to solve these problems.

Thank You,
Fokko Veegens.

CT2 board contains his own "clock patch" you have to remove the old one.

>Will the standard 4MB Atari RAM board work OK?

Yes, also the 14MB board works.

>If you have the standard 4MB Atari RAM board, will this be used solely as
>video RAM and the RAM on the Centurbo used as application RAM (i.e. TT RAM)?

CT2 use the 4(14) MB board mainly as video ram (Chip Ram) (same as amiga does)

>Is the use of TT RAM automatic or do flags need to be set or programs
>re-compiled?

Some progams need to set the flags correctly.
Most of software works well.
NeoN, Apex, Overlay, CAB, aFTP and a lot more.
(Also some games: StoneAge, Defender and more..)

>What is the english documentation like?

Smal.. :->
It's a manual for people they know what the faclon contains..

>What level of soldering ability do you need? I've successfully installed

profi level! Use the fitting service.

>Overscan into a Mega, is it harder than this?

No (For people with the "licenze to solder" :)

>Does it work with Magic 5?
>Does it work with MiNT and Geneva?

MagiC 5 and up to 6 works perfekt (use the MagiC patch out of centeks patch folder!!)
MiNT and Genever i don't know, i doan't have both..

>Thanks for any info.

Take DOITF030, contains all what i know about the CT2 board.

Also i create a HTML manual for CENTEK, contain all what they
wrot down on paper, disk as multilingual HTML.

Sleps still on harddrive, nobody interesst..
I can't put that to my webside, centek must allowed that.. ;/

Looks like a senseless work.. Time to delete it.

Well, hope that helps for the moment..

Fast ... regards :)
Robert

Sorry for that, but as I've read the question above, it seemed _obvious_
to me that he just asked not for the OS itself, but for the "system
software that came with Falcon030". My Falcon came with three floppies
named "Language Disk", "Extras Disk" and "MultiTOS Floppy Boot".

If that's what was requested, please email me (draco@mi.com.pl), I still
have these floppies...

> If it is possible,how ?

Yes, this is possible, but rather expensive ATM. A few different VME-cards was made, but these are hard to find and expensive today. You can also connect a D-Link DE600 pocket adapter to the ROM-port with the aid of a simple adapter (those of you who're waiting for me to ship your adapters, please be patient. I have serious problems with printing the PCB-layouts, but as soon as this is solved I can make a batch.), but again, DE600's are hard to find.

Michael Scwingen has made a simple VME<->ISA adapter that's so small you can fit the adapter and a cheap, standard NE2000-card inside the VME-slot. The adapter itself is finished, and will AFAIK be shipped as soon as the drivers are ready (TUW-drivers exists, but no MiNTnet- or STiNG-drivers so far.).

Steve,

Heat. Check your fan in the back of the case, is it spinning. I have also heard of the power supply failing like this.

Bud

Hello!
I recently found a memory upgrade for my Atari 1040STFM . It's from
Frontier Software and the product is called "Xtra-RAM". I'm wondering if
anybody has got a manual for how to fit this module in the computer.

Please reply as soon as possible.
Best regards
     Henrik

It's easy. Just replace the 2 original ROMs with the 2 new ones. You have 2 jumpers (actually 0 ohm resistors) to switch over too.

There are instructions in the Quick FAQ.

I made a cable (LAN to Modem2) according to the instructions in HSMODEMA07, but it didn't work for some reason. It says in the docs that I need to remove two 100ohm resistors near the SCC chip to be able to

use that cable with a modem, but since it's supposed to be a null modem
cable, I haven't carried out that thing.

i guess i'll have to test that mac cable...

When you intall the ct2, you unplug the 4 gals where the clock
patch is. All the clock are managed by the ct2 much better than
the clock patch.
So you have to remove the clock patch, but it's no problem.

> Will the standard 4MB Atari RAM board work OK?

yes.

> If you have the standard 4MB Atari RAM board, will this be used solely as
> video RAM and the RAM on the Centurbo used as application RAM (i.e. TT RAM)?

most of the time, yes. But you'll need some st ram for dma and
some system stuff.

> Is the use of TT RAM automatic or do flags need to be set or programs
> re-compiled?

You'll need to set the flags of .app/.prg (running in ttram/use ttram). Almost every app/prg have them set. some programs can scan all a partition to set these flags for you. You can clear one or both flags if it doesn't seem to work.

> What is the english documentation like?

dunno. the french one is good.

> What level of soldering ability do you need? I've successfully installed

at least good. you'll have to sold a few wires on very small cms pads. and you'll need a very thin iron too (25W-30W max).

> Overscan into a Mega, is it harder than this?

seems a little harder than that, but I founded it easier than the CT1 (getting used to ? ;-)

> Does it work with Magic 5?

yes, great. (need a patch provided on the floppy)

> Does it work with MiNT and Geneva?

Do ypu really think Katherin would have bought one if not working with MiNT ? ;-)) (you'll need HDDriver, 'cause cecile is not xhdi compliant)

I ordered the Riebl card at Best Electronics in California. I think, it was about 150 US Dollar. At that time I was told, that only one other Riebl was left on stock.

>> Otherwise, there _are_ some SCSI-Ethernet adapters (fairly common
>> on older Mac) but you would need to write your own drivers, cause

> Is there any other way to connect my pc and my TT ? Lan maybe ?

You can do it with a very slow null modem connection from one serial port to another. Another possibility is taking another ethernet card: PAMs VME. It is as well made for the VME bus of the TT. But you have to run Mint then. Last year STinG still didn't offer a driver for it. It has some other kind of addressing and cannot be run with the Riebl driver.

But if you can get hold of a Riebl card - it's a nice thing. My TT is connected to the institutes network and the card works fine under both operating systems: MagiC 5.4 with STinG and Linux m68k (BTW: I was told, that Linux m68k doesn't have trouble with PAMs VME either).

Regards,

Kerstin

Other people have mentioned VME.
Atari one made a card, now know as the Riebl Card for the VME.
Also there is PAM and further more there schould be some Bionet VME-cards made.
Normally Bionet has a separate box connected to the DMA!!

For all these solutions there is software on the ready-to-install
MiNT98 CD-ROM.
So there are MiNTNet drivers for connectng to TCP_IP network

Further: BEST Electronics in the USA has some Riebl cards.

I always see them advertised in his stand when he pops up in Neuss
for the German Atari Fair.

I even bought some cards. For DM 99.

> (1040) ??? I have looked and looked, but have had no success.

The emulator you are looking for is called PC Ditto, it is commercial and
was sold in the period 1987 - 1990. It emulates a PC XT at 4.4 Mhz !!!.
Works with DOS up to version 4.0.
It is slooowww but it emulates perfectly. every DOS program You throw at it
will run.

Cheers from Belgium

Dennis

I aware of old stuff, only available second hand:

PC Ditto (software, commercial)
AT Speed (hardware + software, commercial)

Bye,
/Pascal/

Thanks for all the suggestions and help with this one - much appreciated. The posting from the Newsie author prompted me to go check the log file, which I hadn't realised even existed! Too many users logged on at the time - it only allows 20 anonymous callers at once on ftp.sol.no - must be a popular ftp site!

Cheers,
Gary.

I Have a pair of TOS2.06 chips in an ST that has a video problem, I can
test them in my STe if you want, I guess I'd be looking for 20 UKP for
them....

o> Is this the one published in ST-Computer two year ago or so, where
o> you solder a 4 MB PS/2 SIMM into your ST, or another hack?

It /was/ published in /ST-Computer/ but in the 3/1990 issue! The title translates as 'From 2 1/2 make 3.' No, you don't use a 4 MB SIMM, but just a small logic chip to generate the required RAS and CAS signals for the new bank. The point is that you /had/ to use the 2MB as the first bank, then the existing 1MB (in a 1040) could be used as the second bank; in that way you had contiguous memory that was found during the check at boot-up -- if you put the 1 MB first there would be a gap and the remaining 2 MB would not be recognised.

Regards
/Peter/

I have a ne2000 compatible card in my pc now. I can't imagine a
card like that in my tt. Not much room for it...
But if this works,I'm verry interested...

I have a el-cheapo NE200-compatible in my PC as well, and it's less than 2
inches high. I can't see any problems in fitting this inside my TT's
VME-slot.

You'd be lucky to find one.

Basically, Ethernet is not a viable option on the Atari platform at the moment.

You should try AG Computertechnik then. When Brad Coda told me that only one Riebl was left, I could imagine it wouldn't stay there for long ...

> My bbs software won't run under linux. I have to setup everything
> from scratch under linux. I Linux worht that ?

It depends in what you want to do. I just wanted to learn a little bit more about Unix-relatives and use it as experimental platform. It is difficult to find applications for Linux m68k and some of them, especially the X11 dependent, like e.g. xfig are dead slow! But it is nice if you start learning C or just want to do some internet stuff. At the moment I use it for reading e-mails and usenet. My computer and me are at Copenhagen University and my e-mail account is at Cologne University. So I log in with ssh from here to there.
:-)

(Don't hope, that I will give my Riebl away when I return back home. I already figured out how to keep it employed!)

For surfing the Web, I use CAB with STinG under MagiC, because the graphical linux browsers proved to be quite unstable (I tried three of them: Chimera 1 and 2, Arena and Mosaic.)

Regards,

Kerstin

Um - not quite. The adapter uses a SMC Ultra card (BNC-only cards are
available quite cheap now) - these are a lot faster than NE2000, and produce
a lower CPU load.

The adapter is compatible with Ulrich Roehrl(?)s DIY project, which should
be on some FTP servers - IIRC, it was calles smc_tt.*, and the TUWTCP
drivers come from that package - however, TUWTCP is a sack of bugs ...

not afaik. you can buy MagiC, software to replace your TOS. or install
MiNT. also, Mario becroft is coming out with a IDE card that will give
you 2IDE drives on your ST/e, PLUS TOS 2.06 included.

I notice that there is a download button for the docs at the bottom of the "Presentation" page on Centek's web site IIRC, that might be worth a look! :-)

>>What level of soldering ability do you need? I've successfully installed
>
>profi level! Use the fitting service.

Karl at Systems Solutions here in the UK said that he thought that it was very easy to install, aided by a very clear manual. Since he is the UK importer and would prefer it if his company did the installation it can't be that bad.

Me, I'm most concerned about the possible need to replace some parts removed during the installation of Nemesis - only time (and a look at some docs) will tell! :-))

>>Overscan into a Mega, is it harder than this?
>
>No (For people with the "licenze to solder" :)

SMD components and those inside the Mega are a little like David and Goliath in terms of size! :-)

Isn't there some problem with HDDRiver and IDE drives tho', or am I mistaken?

I can't see that I'll have a great deal of trouble installing mine (the
installation docs are now available for download from Centek's web site).

But it looks like I will have to replace R126 (removed during a Nemesis
installation), so if anyone knows the value of this I would be pleased to
know - also the value of L102 (I could probably reuse the old one but it
would be a good idea to have a spare).

I've looked in the circuit diagrams that are available on the net but
they're not sufficiently well reproduced to be able for me to make the
components out.

Hello techno's

Last weekend a friend of mine tried to install a SCSI Quantum ProDrive LPS
270 into my Hades tower which already host 1 IDE HD and two SCSI-devices
(Zipdrive ID=0, CD-ROM ID=1)
This harddisk has always served as bootdisk on my TT030 and had thus ID=0
Jo changed this to ID=2. Because this device isn't the last one in the
SCSI-chain -an external SCSI 2 port is the last one and is terminated by
means of an active terminator- Jo didn't put the termination on. So far so
good I guess.
However from the moment Jo hooked this drive to the chain all my
SCSI-devices weren't recognised by the system anymore. ID-check didn't see
any device.
Jo tried every possibility he knows but alas nothing helped. As long as
this drive is hooked on the chain, no SCSI-devices at all.
As harddisk driver I use HDdriver v7.6.

What is the problem here?

TIA
Martin

Sure he say that, he's a profi :)
Well the manual is clear, for profis. Other people have questions left.
My manual have wrong page numbers, i have to sort this paper before starting..

>Me, I'm most concerned about the possible need to replace some parts removed
>during the installation of Nemesis - only time (and a look at some docs)
>will tell! :-))

Right, the only part you have to replace is R216, 33R (Ohm).
CT2 doasn't work without them.

>SMD components and those inside the Mega are a little like David and Goliath
>in terms of size! :-)

Right :)

>Isn't there some problem with HDDRiver and IDE drives tho', or am I
>mistaken?

If you have an old 64/80Mb Conner IDE, forget it.
Works fine in normal mode, works also in turbo mode, but only with
Cecile. You can't boot MagiC 5/6 from that device!

I take a new toshiba 2.1Gig MAT, works fine in all conditions.
Also it's a fast device. IDE device must follow ATA4 standard !

Some older devices doasn't do that. Result: trouble with MagiC /HDDriver

Same with an external IBM DPES 31080 1 Gig SCSI, as example, works fine in normal mode.
Works fine with Flash 1.75 / 1.78 in both modes, but not with newer CT2 flashes.. (1.80 and higher)
If you take CT2, you doasn't got older flashes, only new ones .. (1.89 as example)

If you have older devices, sell them.. :/
Have a look to the manual, tell me if you found one word ..

Regards, Robert

And if not parity then initiator-identification?

A point of information:
what show perform the leds of the drive?
If the harddisk driver does not see the drive, does the drive detects
anything? If you let the driver search all ID's on the SCSI, does the
drive light up?

->ken

Hi Ken. Yep, you can put TOS 2.06 in the STe without an adaptor card. I did it, only had to change one jumper thats right near the TOS chip sockets. I'd recommend getting an adaptor card that lets you switch back to older TOS (1.60/1.62) versions anyways, for the odd game or 2 that won't work then... (F1 springs immediately to mind, and there are a few others).

See ya! ;-)

Sure you don't mean R234? It's a 220 Ohm resistor. L102 is an inductor.

OK, I know that it's nearly a death sin to ask this, and I normally wouldn't even think about doing so, but... I need someone to help me to trace down a nasty bug.
Now before people start flaming me, let me explain myself, as this may be of some interest to others as well...

A few months ago I started looking for a cheap method to connect my Falcon to an ethernet. After considering various types of adapter I concluded that the best thing would be for me to buy a little device based on the RealTek RTL8012 chipset. Now this little fella' is a parallel port ethernet adapter, a bit like the good old DE-600, only with much better specs and easier to get. I picked one up second-hand for less than 30 euro, downloaded the data sheet and PC-Linux driver code, hooked the thing up to the parallel and EJP ports and started coding...
A Belgian fellow called Karl Samyn, who was so kind to aid me in the process of choosing the best ethernet solution, attended me to the fact that two French guys, Eric Gaudet and Rodolphe Pineau, were also working on a driver for the RTL8012. I contacted them, and they were so kind to send me the code they had so far. Unfortunaly it was all in assembly, pretty hard to read and not very suitable for what I had in mind (MiNTNet).
Plus I didn't have a macro assembler and proper debugger to test it, and I didn't want to wait months for them to finish it, as I'm in a bit of a hurry to get this thing up and working...

The next three months or so were spent debugging a few kb of my own code.
I am now able to access the control registers and read out the packet buffer using various transfer modes. Once. After that the device locks up and I have to reset all power lines, including my Falcon.
And _that's_ the problem: I'm stuck.
I've been stuck before, of course, but this one bug is starting to drive me insane, up to the point of thinking about giving up.
I've spent the last month going over and over my code, other people's code and the data sheets, found and fixed loads of bugs,
took lots of breaks to calm down and think and even managed to get some work done for university, but it _still_ doesn't work! Aaarrrgghh!

The previous two times I got stuck it turned out to be some

really silly bug which I just didn't notice for a week or so,
and I wouldn't be surprised if it were something like that again.
On the other hand, I could well be doing something basically wrong
on the software or hardware (difficult to trace, I only have an ancient
multimeter which is very unreliable) level, as I'm not an expert on these
things.
It would *really* help if someone with a fresh perspective on things
were to take a look at the code (GCC C and assembly) and the hardware
design. Even a hint at what the problem could be would be superb.
I tried contacting the two French dudes, but they haven't replied.
So that's why I'm trying this slightly more radical approach.
If there's anyone who'd like to help out on this, please reply by
email and I will mail you the details (my notes, the code and the
data sheets) or put them up on my website. And remember, it's for
a good cause: a cheap ethernet solution for Falcons (and in the future,
STE and others as well)!

Thanks,

-=El Vienno

R216! 33R. The docs I downloaded seem to suggest that one is supplied with the kit, but I think that I will buy one (plus 10 spares in case I sneeze!) :-))

> L102 is an inductor.
Yep, one has to lift one end of it for the CT2, but Nemesis needed it cut out completely and redeployed. Figured I might as well get a spare for that just in case, but there's no value listed in the diagram I have. I'm sure that it will be OK tho'.

Visit my web site, grab the Ghostscript English files from the software page, and then follow the link to Christian Felsch's site for the binaries. You'll need the ST version, the PS-550.LZH overlay archive, and the first of the two font packages.

HTH.

I am need help with formatting my 850MB for the falcon. I have been looking on site for a good hard drive formatter for the falcon. I trying to upgrade my falcon to a 850MB from 60MB. But now i am unable to read the 60MB HD? Why is there a program that can help me recover the HD. Some told me that all need to do is just put the drive in and should be seen by tos, But that's wrong. I need to find a program to format and see the IDE drive. I hope some can post or e- mail me a mobie@yhaoo.com and help. I need to try and get an answer this today or this weekend Maurice.

Hi !

I need some technical help, is there anybody here able to burn some code in a GAL chip ?
I have the code to burn but not the GAL itself, it's a "20V8" model.

Please, could you contact me for further help ?

Thanks for any help

Jo

Can't really say, but I absolutely love my Sony 100ES 15" monitor
with a .25 dot pitch. Not only does it have a great picture, but it
has very convenient and easy to use digital controls on the front.
My next monitor will probably be the 200ES 17" version.

>I know I can still only get 640x480 or 800x608 with Videlity (new graphics cards

Actually, I can get up to 1024x656x16 with my ScreenBlaster. The
picture quality is great at that res, though obviously everything is
a little smaller.

The dongle is the little cartridge that plugs into the cartridge port on the Atari and when the software runs it looks for the dongle and reads info off it to make sure that you have a ligitimate copy of the software and not just downloaded it from the net somewhere.

regards

I have an ageing 14" colour VGA with 14 meg Falcon. If I change to SVGA 14 15 or 17 inch, will the picture definition be appreciably better? .25 better than .28 etc?

I know I can still only get 640x480 or 800x608 with Videlity (new graphics cards on or over the horizon as yet...), but does SVGA deliver a finer quality picture at those resolutions. Is it worth the expense of 17"? Used mainly with Cubase Score, DTP and Music Notation apps.

Many thanks for facts, opinions etc

CJ

I could do it. But problem is that I'm too far from you. Anyway, if you will not find better solution contact me to private mail.
Btw. GAL you could find in any better Electronic store.

In 95% of all hard drive replacements the hard drive doasn't need to format.
Connect it, create your partitions, that's all. (If the drive is new)

The way to replace the internal falcon IDE you found as complete description in DOITF030. The free Hardware Manual for the FalconF030.

Best Software to format & part., is HDDriver 7.6
(With support)

I'm sure you can't found any comparement as download on the web.
Try the demo release of HDDriver.

Also you can use latest release oa AHDI for that..
Old, slow and no support.

You doasn't need to format the drive only that the machine "see" the device.
It's enough if the machine found a drive on this drive.

Sure, while installing the driver, media must have atari compatible format.

Hope that helps.
Regards, Robert

Yes, you can take 1/10 W (smal SMD) do the job.

>It's a Maxtor 25128AT, 1993 according to the label.

I don't know if it works with MagiC, test it before kick the drive!

>Will I be able to boot MagiC from either SCSI or the IDE drive that I have
>with Cecile? IIRC Kath says that Cecile isn't XHDI compliant (perhaps this
>is a different issue).

I'm not sure. I doasn't check it that works. IDE looks faster.
It's true what Kathrin says, she have the same trouble.

If your devices come clear with cecile, you doasn't have to chance the
format ect. Cecile handle XHDI partitions well, but not it you have
it on an old IDE/SCSI device. Watch ATA4 !
That works fine in normal mode, also in turbo mode, but you have a
good chance for any trouble. (Like my description with MagiC)

>Hmm, maybe I'll be lucky - but what of my Microtek scanner (with ScanX), my
>CD ROM, Syquest, tape streamer (that's ancient!) ? Time will tell.

Sorry, must pass this question. If the driver works..
No chance to test it out here.

It really depends on what you do most of the time.
If you mostly read texts from your screen, a larger screen area with
more pixels lets you have more text with the same physical char height.
If you use mostly use imaging apps, the same screen area with smaller
dot pitch gives you sharper pictures (at normal reading distance of course).

Henk.

Nope - we are still alive and kicking. :)

If you are looking for www.cyberstrider.ORG, the server is moving this
weekend. The leased line was shut down and a new one is now up and
running. The servers are in the process of being brought back to life
and should be up and running by Monday.

Due to the new leased line, a whole host of routing needs to be set up
etc etc etc.

if you are looking at www.cyberstrider.NET - that is still there, but
the links from there lead to the .org site for the moment.

Apols for the inconvenience, but I was expecting the older leased line to still be operating for another week.

Regards
Danny

Which DeskJet do you use with Atari? I have TT030 and Falcon. After research indicated the DJ712c would work with MS/DOS (therefore with TOS), I got one .. only to learn in setup manual that 712c requires Windows -- although that was not shown in specification sheets or advertising leaflets. It works with MS/DOS, but ONLY through Windows.

Also required is a bi-directional parallel printer port (that is, it must be IEEE 1284 - compliant,and Atari is not).

What do others use? I don't need Plug-n-Play interface for sure, but I would like to print at 600 dpi and in color. (currently I use the DeskJet PLUS at 300dpi ... and this one has DIP switches).

TIA for comment/advice. Best 73s... Email direct if you should like to:

A fellow former user group member gave me all his Atari stuff a couple of months ago, as he expects to move soon and hasn't used his Mega ST4 in 2 1/2 years. (Using the Spectre GCR seduced him over to the Mac when new ST software slowed to a trickle) I've been an 8-bit user since 1985, and am rather new to the ST, but I'm learning. I expect to have a few questions from time to time, and tonight is the first one.

The inventory included two Atari SLM804 laser printers. They were supposed to each have drums and toner carts that were about half used up, but when I tried them out the results were so faint as to be barely readable. From my reading I've decided the drums need replacement, since the specs say there is a 2.5 year storage life on the drum. Also included in the inventory was a sealed-in-the-box drum kit, so I'll probably try that first. My questions:

The drum kit is a minimum of three years old, probably more like five. Is it going to be any good any more?

Is there a shelf life for the toner? I don't have any sealed toner carts. What I have has been kept dry, as far as I know.

Is there a (reasonably) cheap supplier for drums and/or toner carts? And, what is the cost these days?

I saw a DeskJet 400 in Walmart the other day for $98. If what I have doesn't work, would I be better off to buy one of them? Are there drivers available that will work with that DeskJet? (SpeedoGDOS, Word Perfect 4.1, Pagestream 2.1, G+Plus, etc.)

That should keep you busy for a while. If I think of something else, I'll get back to you.

TJ

My 672C was plug-n-play. Comes with Windows software, but you don't
need it. Has separate b&w and color cartridges. I believe it prints
in 600x300 in b&w and 300x300 in color. It's a very nice printer. I
believe I got it on sale for something like $130 at Office Max.

On fri, 15 Jan Torfi asked;

>Does anyone know if Epson FS200 film scanner can be used with TT? It's got
>SCSI I, but i'm wondering about the software/driver part...

I friend of mine has got one, I persuaded him to bring it along. Although the
scanner is recognised by the TT. None of the existing software supports it.
So until someone writes a driver, the answer is unfortunately NO

Cheers from Belgium

I've acquired a couple of Mega STs. I Like ST systems but use a PC now. One of them comes with an Atari Hard disk unti but with no cable or system disk. Please could you point me to where I can get a pinout diagram for the cable and a system disk. I think the HD is set up and working but obviously have no means of knowing.

Hi Robert. This is a little off-topic, so forgive me, but since you do
have a CT2, I was wondering if you also have an FPU. If so, does the
MP3 player work with this setup? Thanks! ;-)

I still have two Joystick which fit into the ATARI mouse/joystick
plugs. The cable doesn't fit into my PC-Soundcard-joystick port. Is
there any adapter on the market to keep the joystick using??

Hi folks,

I've just gotten my hands on an Atari 520 STFM. Both the mouse and
joystick are suspect - the mouse has the wrong ball fitted.

Does anyone know where I can get a new mouse and joystick ??

Due to the fact that I have 2 complete Atari set-ups,with hard drives
ETC,....
I dont need both of them,so I am selling one,

I have an Atari STe,upgraded to 4meg for sale.
It is in full working order,and has no faults.

I am open to sensible offers,..plus postage.

Please e.mail your offer to me.

All the best,
Keith & Laura

Here's stuff I've got;

SCSI Terminator 50way
SCSI Terminator 50way with pass through
SCSI 50 way to 25way cable (normal cable as supplied with a lot of hardware)

Various other cables and connectors (lots in fact, some very rare)

Acorn keyboard suitable for early Arcs upto A5000 (not all in one models)

68040LC33 chip (has been tested successfully at 50MHZ)

14" SVGA Monitor with electronic framing controls

Akai AV Amp with internal B/W monitor (good for linking all sorts of Audio and video equipment together. Also has fake suround and shapness control. Originally 240 RRP (paid �200)

Amiga 500 with monitor and printer and spare 500 without internal disk drive

Acorn Arm250 range Technical Reference Manual with pullout circuit diagrams of the various models and boards

20MHZ and 25MHZ 68881/2 FPUs (pins underneath)

Arm2 chip (12MHZ compatible) Arm3 socket compatible.

Lots of 256k Simms (obviously ain't worth much)

CD containing lots of ROM files for consoles and arcade machines. Also Atari ST and Amiga CDs

boxed Vectrex console with 6 boxed games

Sony 2x (340k per second) SCSI CDROM Drive bare (2 off) perfect and very good at loading difficult CDs

Intel 486sx chips

Various Bond film videos

64MEG IDE 2.5 notepad/Amiga 600/1200/Falcon type hard drive (perfet working order)

210MEG Caviar 3.5 Hard drive (perfect no bad sectors)

Floptical disks (21MEG each)

Stuff wanted

EZ135 carts

AMD/Cyrix 586-133 chip (486 socket type) possibly except
slower version

SCSI 50 way to 50 way cables (2 or 3 would be nice)

SCSI 50way cover

Arm3 30-35MHZ board

BBC hard drive interface or simply a duff BBC hard drive
where the drive itself has gone wrong)

Mac LC630 battery

A3010 internal battery

Playstation

32MHZ 68882 FPU with side pins
50MHZ 68882 FPU with pins underneath

Pentium 2/Celeron with external cache processor

Dimm memory

>Anyone know how far it is possible to overclock the MC68000?

The normal versions: not much. The CMOS versions (68HC000-16) from Motorola and Toshiba seem to run fine at 32MHz - I had one running at 36MHz on a modified MagnumST ram card without problems (and without getting hot). Together with 0-waitstate fast ram, this beats a 68030@33MHz PAK-3 (which did have cache, but no fastram) easily.

If you think about just increasing the CPU speed, without cache or full-speed fastram: forget it - it gives you only a few percents of speedup.

I'm having difficulty with Newsie trying to read anything from a certain ftp site mentioned in an earlier posting about TOS errors (ftp://ftp.sol.no/users/h/hallvart/atari/info/tos_err.txt) and keep getting "SERVER DENIED ACCESS" and "EOF FROM REMOTE".

Anybody managed to get this to work? (and if so, how?) I'm new to ftp so it might be something I've set up incorrectly. Hallvard has checked the site itself and can read it with his setup, but I only have my STe with STiK/CAB/Newsie at the moment, so I'd prefer to use this if possible.

Cheers,
Gary.

:Occasionally on booting all I get is a rolling screen but
:after its warmed up left on in this state (lets say a
:minute) its ok.

Sounds like a bad solder joint. Try some cooler-spray
and isolate the area.

Alternatively you could ply out the socketed chips
and reseat them in case the connectors are oxidated.

:Should I fit a fan and what power point should I use?

A fan for the PSU is always a good idea. You could tap
from on of the cables going to the motherboard.
Assuming your fan uses +12V you could tap from the blue
cable for plus and from a ground point (black cable) for
ground.

I guess the Hardware Book should have this. Type "hwb" in Yahoo!
There are about a dozen mirrors of this excellent site. You can
even download a ZIP archive of the whole site, for home usage.

I take it that you have login set to anonymous and the password set to your e-mail address in the ftp edit server box.It you have not you will need to set these.

I also found that some ftp sites need all the options,apart from save last directory,turned off in the preference,ftp dialog.Some ftp sites don't understand all the commands.

Hi,

I seem to be having major problems with my hard drive setup..
Wondered if anyone had any ideas. It did work; I moved house
had the stuff in the garage for a month and now it doesn't work..

Here's the setup -
4Mb STe connected to an 80Mb IBM hard disk using the Link2 convertor.
[I've tried the (SCSI) drive on my PC and it sees the ID string but
  cannot mount the drive (fair enough I expect the FAT's different).]

The red light is ON on the Link2 so that's getting power from the
SCSI bus..
I can't boot from the hard drive - so I tried booting from the ICD
disk A (plus tried running coldboot) and it says:
"ID 0 ..." I forget the exact message but essentially is says no device
found or something..

If I boot without the hard drive on - it says:
"No ICD host adapter detected" - so I guess the Link2 is sort of working..
Any ideas from this??

I'm quite desperate as lots of development code is on the drive and my
backups aren't too up-to-date :-(

Hope someone has an idea of how I can sort it out - otherwise it looks
like I'll give up with it.

Kev

Have you tried cleaning the contacts? It's amazing what a garage can do to electronics...

Hi,

Does anybody know a way to connect a Atari TT to an Ethernet network.

If it is possible,how ?

Hello Gary,
about 'ftp with Newsie' you wrote:

>I'm having difficulty with Newsie trying to read anything from
>a certain ftp site
I've always had trouble FTP-ing with Newsie. Try to go to the Belgian
FTP-site 193.190.205.13 directyory pub/atari/incoming/amail/ and get
aFTP15B.zip. If you want to FTP just use aFTP, not Newsie, and life
will be easier. (I've always had trouble trying to typ blind after
visiting the Spanish restaurant 'Centra' in the Lange Niezel in the
red light district in Amsterdam. Wonder why....).
Regards, Joost.

Well, I've finally decided to give up the TT system. I also have a few items I'm selling separately (prices don't include shipping, if you don't like a price, feel free to make an offer):

Floptical and 5 21 meg discs (internal)	$ 75
105 meg Quantum LP105S SCSI HD (internal)	$ 35
Maxtor 40 meg SCSI HD (internal)	$ 15
NEC 3Xe external CD-Rom drive	$ 50
TT system:	$500

TT030 10/16
48 MHz CaTTamaran
Nova ET4000 1 meg card w/ v2.08 drivers (fitted inside TT, up to 800X600X32K) 40 MHz FPU (Motorola never supported over 32 MHz officially in PLCC, but my distributor got one from Motorola that was tested to 40, which I needed to get the CaTT stable)
TOS 3.06
HD floppy
External Quantum 340 LPS drive

You can't put a hard drive in the TT case because the stock power supply can't handle the accelerator, RAM, Nova, and a hard drive. The back of the case isn't perfect (the fan slots have been opened to a hole to increase air flow and the video card mount is functional, but not perfectly clean).

Calamus SL98, ExtenDOS, NVDI 4.11, and much more software would go with the system.

There is a guy in New Zealand that make an interface, in a very neat
little package, that allows a serial mouse to be used on an Atari

The right dir is just atari/incoming/internet/

I never succeeded to use Newsie myself. aFTP or MFTP are much better
programs for this purpose. Even the good old Oasis 1.35 did a better job
then Newsie.

Hello Martin,
about 'Re: ftp with Newsie' you wrote:

>The right dir is just atari/incoming/internet/
Okay, okay ;-). Martin, I'm very happy with the work you do in this
FTP-site. I've become a regular visitor, there's good stuff there and
access is easy. Keep it up!
By the way, Gary Smith, if your still listening in, it was a bit of a
silly suggestion to FTP a file needed for the solution of your FTP-
problems. You can visit the webpage of the makers at
www.pwp.cz/atack/ or if you want I can mail the aFTP program to you.
(It is 182kB though). Regards, Joost.

I am using an Imation SuperDisk LS-120 on a PC, and would like to be able to
connect & use on my ST to back up the hard drive. The connection to a PC is
via a cable to the parallel printer port.

Any ideas out there?

Thanks David Cree

Yes I did this with Hallvart One year ago.

You want
ftp.sn.no
follow the rest of the way by command or click. Your choice.
HTH.

I got the same message. Others FTPs get redirected properly.

I have 2 SC1224 with 3 knob/dials located at the right side.
How do I identify which manufacture it is.
I also have 2 with the sloped back buttons front and right.
I have one with push button front contrast/sound on left.

Of course the First two mentioned don't work and I would like to fix them.
Powerlight, black screen.

Don't mention buying another monitor. I have plenty.

I also have an SM 125 which has also popped.
I have a schmatic for the 124 which is not the same.

Any help would be greatful.

Thanks.

Falcon OS is a ROM Chip. Releases from 4.01 -> 4.04 (latest)
Why do you need the OS?

Falcon contain a IDE Harddrive
You can replace the old smal device with other IDE devices
from xx up to xx *GB*

Same interface, same device driver.
TOS handle partitions with the bigest size of 1Gb.
(That's - NOT - the device size!!!)

If you take a 8Gb device you got 8 partitions, 1GB each.., as example

Enough space for years ....
(Same with 2.1Gb devices, 540MB device..)

Selling my 2.5" 540Meg device for 140 DM (without p&p)
(I replace it with new toshiba 2.1 Gb MAT for ~300 DM)

Regards, Robert

Does it try to read the floppy? Does the drive light come on? If not
then it is probably just a loose power plug. You will need to get
inside, clean things up and connect it properly.

If the floppy tries to read the disc but fails it may be because the
data connection is loose - clean this up and re-connect. You should
also check that any socketed chips on the ST motherboard are firmly in
place.

It is unusual for a floppy drive to fail completely - they are very
simple devices.

If all the above suggestions do not make it work you may have to get a
replacement FDD drive. See Hallvard's page for suggestions on drive
models and how to do it.

t> I have troubles with my beloved Atari 1040 ST. It doesn't see my floppies
t> anymore :O(I mean inserted. What could be possible the problem with it?

Do you here any noise while select the drive icon on desktop?
(Double click on it)
You doasn't see and drive icon on desktop? (Good chance for a new DMA ;/)

- drive death, power less
- dma chip fault
- wd1772 fault
- ttl driver fault
- motor on, drive select comes from psg chip, chip fault

If you hear nothing, check +5V/+12V on drive.
Smal connector left back side of drive, black wires are GND
Check floppy wire. (Broken tracks)

Your problem is one (or more) of the listed points upper.
(If power and floppy wire are ok)

Hardware people locate the problem with a simple logic pen.
(All data come thrue DMA/WD1772, Motor on and Floppy select from PSG)

I hope i'm not wrong, if you need more help, i pick up the relevant
points out of the 1040 schematics. Also you can take the 1040 schematics
from several points of the www

Good look

Regard, Robert

Hallo!

Ich habe hier einen TT der leider nicht mehr von der Platte aus booten
will.
Leider habe ich auch keine original System-Disketten mit den

entsprechenden Einrichtungsprogrammen :-(
Von einem FTP-Server habe ich mir das Paket HDX gezogen und versucht die Platte zu installieren.
Die Platte und Controler sind OK, AHDI findet die Platte und mit HDX koennen auch die Partitionen erstellt werden. Wenn ich dann HDINSTALL aufrufe, schreibt er auch kurz was auf die Platte. Dann kommen kurz zwei Bomben und er springt zu GEM zurueck.

Ich vermute das was an meiner selbst erstellten Diskette was nicht OK ist.
Wer kann mir weiterhelfen?

Die HDX Diskette habe ich auf einen PC erstellt ...koennte das ein Problem sein?

Verwendet der TT vielleicht ein anderes Tool um eine Festplatte zu installieren, wenn ja kann mir einer vielleicht sagen wo ich dann dieses Programm bekomme?

Vielen Dank fuer Eure Hilfe!

Mike

The english text follows this one.

Notre dernier message concernant la CT2B contient une information incomplete:
Il n'y a pas de soudures entre la CT2B et le cable nappe et non pas entre la CT2B et la carte mere.
Une nappe de 16 fils est fournie.
Un cote doit etre soude sur la carte mere et l'autre cote est un connecteur
a plugger sur le bord droit de la CT2B. Ainsi on peut retirer et changer la
CT2B sans aucune soudure.

Sincerement

ENGLISH

Our last message about the CT2B contains an incomplete
information:
There are no solders between the CT2B and the ribbon cable, not
between the CT2B and the motherboard.
A 16 wires ribbon cable is furnished.
One side has to be soldered on the motherboard and the other
side is a connector to be plugge'd on the right side of the
CT2 B.
So, you can remove and change the CT2B without any solders.

Regards

Rock Solid Midi Timing!

*Atari 1040 STe with 4 megs of RAM (lots for this machine)
*SM125 - Monochrome Monitor
*SC-1224 - Color Monitor
*SMPTE Track Gold with external SMPTE Box
*External Maxtor scsi 245 meg HDin FaST metal case
(this cost me $700 new - oh how times change)
the HD is full of stuff too... find what ya like delete what ya don't
need. I've not used this computer for a while but I just loaded it up
and it werking PERFECT.

you can have a bunch of games too I won't need em... (lemmings 2,
bloodwynch, dungeon master etc)
I'll even toss in a Star NX 1240 24 pin Printer with extra ribbon.

All the hardware is in VERY Excellent condition....

$400 get the lot
you pay shipping

may consider a trade for some external signal processing... I could
really use a good compressor

Hello.

I have just got an old Atari Mega STE, and two Megafile 60. However, since I do not know much about the Atari, I have some troubles getting the drives to work with the MegaSTE. The drives seem to be physically ok (at least they come up) but when I connect a drive to the computer, the OS does not see any disks, neither the internal HDD nor the Megafile.

What needs to be done to connect such a Megafile to my STE?

TIA,
/ferdl

Yes, it's possible.

You need a Riebel Ethernet card that fits into the VME slot and
drivers for STinG or MiNTnet exist.

Otherwise, there _are_ some SCSI-Ethernet adapters (fairly common
on older Mac) but you would need to write your own drivers, cause
no one has dared trying yet.

Now that's Funny. I had a hd crash. Loaded in an old .82 NEWsie with the
ftp.sol.no thinking it was the problem one. So I tried ftp.sn.no (because I
remember some things) and it worked for me. I had just tried it before I
posted to make certain.

Well, I guess both addresses work for me:-).

I've connected my TT to a Novell NetWare3.12 LAN with a PAM-VME
Network Card (Frame 802.3, 10MBit/s). No Probs. PAM Cards are very
rare (and therefore expensive). I've seen some at AG Computertechnik
in Germany.

Erm... The OS is in ROM. When you boot the machine, it should come up after a few minutes. If not, then you have a hardware problem or some software conflict. There is no system disk or alike.

The HD upgrade is easy. The drive is a 2.5" unit like those used in laptops, you can put in a 3.5" IDE drive if you have a 2.5" to 3.5" adapter. You'll probably have to cut away some of the shielding too.

It's possible, but you'll have to get your hands on one of those VME/Ethernet cards, which are VERY hard to find. They are not sold anymore, and there seems to have been only a very small quantity ever made.

Once you've got that, it shouldn't be a problem connecting with MiNT or STinG.

When the machine boots up, what do you see scrolling by ? Do you see the AHDI detecting each drive? If not, then there is probably some hardware issue. Does it boot with just the internal HD ?

Otherwise, all you need might be to make the icons on the desktop and save the desktop.

(Robert A Riddell wrote about using a serial mouse on an ST)

The guy who makes that serial to mouse adapter for the ST is Mario Becroft. Go to my web page (link below) and check the Atari News section. I have a photo of the converter cable, a brief description of it, and a link to Mario's homepage.

Mario is located in New Zealand. I exchanged some E-Mail with him a few weeks ago, and he sounds like a nice guy. He does have a North American distributor, located in Canada. I just ordered one last week, and after doing a little exchange rate calculation, it worked out to be about $31 US including shipping.

Mario is also working on some other projects, including a PC mouse/keyboard to ST converter.

Robert, you are better off going with this converter instead of using a mouse driver & the ST serial port. The serial port option works fine for basic GEM apps, but if you need mouse support in a game, or certain GEM applications, good luck making it work.

I recently picked up a Mega STe. This system is the 2mb model, with a 40mb hard drive (Seagate ST157N-1) and TOS 2.05.

I was informed before I bought it that the hard drive did not work properly. I took the system apart over the weekend, and verified all cable connections, etc. Everything looks fine on the inside. The drive is getting power, and it does spin up when the computer is turned on.

I am using AHDI v. 6.06. When I run AHDI, it states that there is a device on ID #0, but it cannot identify it. I get that same message on my Megafile 30 attached to my Mega ST 4, and that drive works fine, so I didn't think too much about that.

Next, when I run HDX, I get a "Critical Error" message. When I hit OK, the HDX menu comes up. I am unable to zero/partition/format the drive from within HDX. In fact, HDX doesn't even see that a drive is installed.

I had a spare IBM 200mb SCSI drive sitting in my pile of spare parts, so I decided to plug it in and try it out. Guess what? Same problem. (I'm not sure if this drive would be supported anyway. I have been unable to determine of this drive requires parity.)

I am hoping that the SCSI controller isn't shot, but I suspect that it is. Are there any other internal SCSI adapters that are compatible with the Mega STe? I suppose I could replace it with another Atari SCSI controller, but then that whole parity problem comes up again, and that limits my choices for hard drives.

Any suggestions for additional things to try would be appreciated.

Mike Stulir

Having read K.Ellis's description of her experience with the Centurbo Falcon accelerator it sounds like a worthwhile upgrade. Has anyone else installed one and/or does anyone know the answers to these questions:

If you have the hardware clock-patch installed do you need to "undo" it?
Will the standard 4MB Atari RAM board work OK?
If you have the standard 4MB Atari RAM board, will this be used solely as video RAM and the RAM on the Centurbo used as application RAM (i.e. TT RAM)?
Is the use of TT RAM automatic or do flags need to be set or programs re-compiled?
What is the english documentation like?
What level of soldering ability do you need? I've successfully installed Overscan into a Mega, is it harder than this?
Does it work with Magic 5?
Does it work with MiNT and Geneva?

Thanks for any info.

TOS 2.06 will work in a STE without modifications. If you have a 2.05 in 28-pin ROMs, you will have to change (solder?) jumpers for 32-pin EPROMs.

   Tia:

   Just trasfer the midi files from the TT to standard PC 1.44 discs
   amd load them into the PC from that. Simple Enough! The TT reads PC
   formatted discs and if you have neodesk, it also PC formats it
   too!(to 1.6M)

Atari Falcon For Sale:

Atari Falcon with 84 meg internal HD,14 megs of RAM,
math co-processor installed, and RGB,VGA monitor adapters,
with manual and box. HD is loaded with all ORIGINAL
Falcon software, inc. Atariworks, plus much more.
Price in USA $650.00 plus shipping/COD.

I also have the external TOAD Syquest 88/44 hard drive,
which was a perfect complement for backing up internal
HD. The Syquest will write to 88 meg carts, and read 44
also.It comes with cable, and 7 - 88 meg carts.
There's a 14.4 ext. modem if needed.
The price of the Falcon and external HD stuff is
$775.00 plus shipping in USA/COD.

If there is anyone in the NYC area, that would be interested
in picking up the Atari Falcon, instead of mailing it, I will include
an Atari SC1224 monitor in excellent working order, for
free.

If interested, please leave Email for Barry Summer at:
bsummer@delphi.com

Happy holidays, everyone!!
Barry

Hi,
I have been an Atari ST user since they first came out.
I use my 1040 STE 4meg for MIDI exclusively.
My monitor is starting to black out from time to time, so I am thinking of
starting to use my Pentium for midi as well.

Is there a better way to port to the Pentium other than saving creator files as midi standard to a floppy and importing it to cakewalk?

Is there any utility that might help me with this?

Thx in advance

:The composite sync/video pin-can this be used as a source of just
:composite sync then?

I tried that on my TV set with SCART (28" Phillips) but it
was better to connect from H-synk and V-sync, through two
330ohm resistors instead.

The Falcon030 video connector:

```
     1   2   3   4   5                9   10
     R   G   B  MV  GND               A  GND
   +----------------------------------------+
   | O   O   O   O   O   O   O   O   O   O |
    \                                     /
     \ O   O   O   O   O   O   O   O   O /
      +---------------------------------+
      GND  Cs  Hs  Vs         +12V  M1 M0
       11  12  13  14          17   18 19
```

R = Red
G = Green
B = Blue
MV = Monochrome Video
GND = Ground
A = Audio
Cs = Composite Sync/Composite Video
Hs = Horizontal Sync
Vs = Vertical Sync

The state of M0 and M1 is high unless you tie them to GND.

M1	M0		
0	0	ST Mono	(SM 124, SM125�)
0	1	ST Color	(SCC1224)
1	0	VGA	(various VGA monitors)
1	1	TV	(TV by SCART)

The SCART connector:

```
  CV GND VBL  GND        +12V  A  GND
  20  18  16  14  12  10   8   6   4   2
+------------------------------------------+
| []  []  []  []  []  []  []  []  []  []   |
 \                                         |
  \                                        |
   |[]  []  []  []  []  []  []  []  []  [] |
   +---------------------------------------+
    19  17  15  13  11   9   7   5   3   1
       GND   R GND   G  GND  B  GND
```

CV = Composite Video
VBL = Vertical Blanking

```
Falcon030                       TV SCART
```

```
 PIN             SIGNAL           PIN

  1-------------- red --------------15
  2-------------- green ------------11
  3-------------- blue --------------7
  5-------------- GND ---------------5
 10-------------- GND ---------------9
  9-------------- audio -------------6
 17-------------- +12V --------------8
       ____
 13---|R330|----H-sync ---+    +----16 VBL
       ____               +----+
 14---|R330|----V-sync ---+    +----20 C-sync
```

On most TV:s you can skip the +12V signal and do the switching by remote control.
If you have a spare lead left over you can connect it:

```
Falcon030                     TV SCART

11--------------  GND -------------13
```

If you want to record your screen to video tape:

```
Falcon030                    Video SCART

 PIN             SIGNAL           PIN

  5-------------- GND --------------5
  9-------------- audio -------------6
 12--------- composite video --------20
```

Here's another way to go (F030-->TV-SCART, alt. 2)
But the picture is better in the first proposal.

```
Falcon030                       TV SCART

 PIN             SIGNAL           PIN

  1-------------- red --------------15
  2-------------- green ------------11
  3-------------- blue --------------7
  5-------------- GND ---------------5
 10-------------- GND ---------------9
  9-------------- audio -------------6
 17-------------- +12V --------------8
 12------------- C-sync ------------20
 14------------- V-sync ------------16 VBL
```

The standard VGA connector:

```
       R  G  B    GND
       1  2  3  4  5
   +-------------------+
   |   o  o  o  o  o   |
  6 \ o  o  o  o  o   / 10GND
     \ o  o  o  o  o /
      +-------------+
      11 12 13 14 15
            Hs Vs
```

```
1 Red (Analog)   6 Red   Return    11 (ID0) GND (Color)
2 Green (Analog) 7 Green Return    12 (ID1) NC (Color)
3 Blue (Analog)  8 Blue  Retuen    13 Horzontal Sync
4 Reserved       9 No Connect      14 Vertical  Sync
5 Ground        10 Ground          15 No Connect (or???)
```

Here's a cable that has been working for me:

```
Falcon030                          VGA

 PIN             SIGNAL            PIN

  1-------------- red ---------------1
  2-------------- green -------------2
  3-------------- blue --------------3
  4----------- monochrome ----------15
  5-------------- GND ---------------5
 11-------------- GND -----------6,7,8
 13------------- H-sync ------------13
 14------------- V-sync ------------14

 10--GND---+
           |
 19---M0---+
```

:Does the system know if it is connected to a 15.75KH RGB source?

It does if you tell it. See the note on M0 and M1 above.

:Also, the +12V out, it seems that the GND pins listed, not the RGB
:return GND Pins, are for this-correct?

Normally you'd connect this signal only to a TV.

MG

hi all
I have an Atari SLM804, and lately the print quality has become very faint.
some parts of the page will show the text just fine, other parts will be very faint or non existant!
does this mean I must replace the drum?
I have already tried cleaning the printer, and adjusting the toner density, with no success.
thanks.merci
ken

Which Hewlett-Packard Deskjet printers are not useable with my Atari TT030 and Falcons? I have read some are Windows only. Is it safe to consider any HP DJ printer to be useable if it also works with MS/DOS?

Is NVDI 5 the final answer? Is there a file location of printer drivers somewhere to used with PageStream and modern color and Hi-density printers?

Best regards and my thanx... stu

Hello!

I am in the USA so SCART is fairly useless to me. I just wish to know, I have a RGB monitor, with, R,G,B and CSYNC. Will the csync line be enough to drive the 15.75KHz RGB monitor?

Can a HSYNC line, and a VSYNC line be combined just through 300 Ohm R's??????????????????????????

Nothing against you, but this no spam additions to email address is just about pissing me off. Are we all so concerned about 10 meg swap files, that we need to do this? Am I naive in this thinking? Often times I wish to respond right then and there to somone, via private email, and too many times I get a "spam" block.

Regards,

Jim W. Krych

All DeskJet-printers are AFAIK PCL-printers, and will work fine on
your Ataris.

> Is NVDI 5 the final answer? Is there a file location of printer drivers

NVDI5 has drivers for most current printers (but no postscript :-( ),
so if you're running MagiC it's definitely the answer. It doesn't work
too well with MiNT, TOS and Geneva. I'm using it with MiNT/N.AES now
though, but only because it has a proper 670C-driver.

> somewhere to used with PageStream and modern color and Hi-density
> printers?

Not to my knowledge.

Has anyone any idea as to where these leads fit.
I have just fitted a scussi drive into an external case
that previously housed a smaller scussi drive.
The main leads are easy enough to fit and the new 4.5
gig drive has formatted and works fine on a Falcon.
There are smaller leads that connect to the id switch and
the activity led on the case. These fit to the new drive but the
problem is where. The removed smaller drive used different
connectors although there are some leads that look to fit the
new 4.5 drive which has a marked strip connecting block.
Anyone familiar with this.
Regards Bill

When no banding or stripes occur: ii is the drum.

>does this mean I must replace the drum?

Yes, or find a secondhand SLM printer. But then again: they arenot
new and how log the drum is used.....

>I have already tried cleaning the printer, and adjusting the toner
>density, with no success.

One thing you could try: put it for a few days in a really dry atmosfere and see if anything changes for the better. If not: it is the drum again.

>300 Ohm R's??????????????????????????

Yes they can but electro(ni)cally you should not.
The next best way is: add someone-way diodes. Then the out-signal of one cannot creep unwantedly back into the signal transistor of the other.

 j> numbers. Does anybody know which application generates these
 j> files?

Not really, but they *could* be files for straight printing out from the desktop on printers understanding the HPGL language, like DeskJets and LaserJets. Try it and see. Or look at the start of the file with a hex editor; if there is something like *t300R or *t150R there in ASCII (or 1B 2A 74 31 35 30 52 or 1B 2A 74 33 30 30 52 in hex) then it is almost certainly this type of file. I came across similar files with the ET-4000 project by Torsten Lang, though these had a LJ3 extension.

Regards
        /Peter/

It is designed for automatically SCART switches, 10mA
Internal Falcon PSU deliver a max. of 300mA / +12V
It's used by Fan, serial, and Videoport.

+12 comes thrue R34 (10K) to Pin 17 of the Videoport.

Regards, Robert

No. You shouldn't try using this switching
voltage for anything but for letting a TV or monitor
"feel" it. If the device has such an in-signal at all.

:csync line be enough to drive the 15.75KHz RGB monitor?

Yes, provided you code the M0 and M1 ID pins correctly.
You should obviously decode for ST Color or TV. Easiest would
be to try the TV setting first. Since both M0 and M1 should
be high (ones) you needn't do anything, just let them be.

M1	M0		
0	1	ST Color	(SCC1224)
1	1	TV	(TV by RGB)

:Can a HSYNC line, and a VSYNC line be combined just through
:300 Ohm R's??????????????????????????

330 ohms is the best value I found. Yes it's as simple as that.

:Nothing against you, but this no spam additions to
:email address is just about pissing me off.

Sorry about that.

:Are we all so concerned about 10 meg swap files, that we need
:to do this?

Don't think I follow here?

:Am I naive in this thinking? Often times I wish to
:respond right then and there to somone, via private email,
:and too many times I get a "spam" block.

My reason for scrambling my return address is that I used to receive copious amounts of spam mail, all with two themes: Get-rich-quick! and Free-sex-fest-for-you! After the first 50 letters it started to be annoying...

Obviously there are bots, programs that cruise the Usenet in one way or another, these reap all poster's return addresses and send this crap mail to them (us).

By scrambling the address in some obvious way, all humans with an IQ of 26 or above deduct that the address should be edited, whilst the bots can't make this deduction. Therefore I receive no more Get-rich schemes and no more Slutty-wants-you-baby, which makes me happy, saves on my telephone bill and keeps my Inbox clean.

Everyone who really wants to send me an email will just have to go thru the trouble of descrambling my return address. It's easy:

graiter@SPAMLESSstarmail.com ==> graiter@starmail.com

You'll be doing it as well, mind my words...

;^)

You'll regret it ! sooner or later !

Why not replace/fix the monitor ?

> Is there a better way to port to the Pentium other than saving creator files
> as midi standard to a floppy and importing it to cakewalk?

Not really. You can also try transmitting them thru MIDI, but the result
will be the same. You will lose all the creator-specific data.

��All DeskJet-printers are AFAIK PCL-printers, and will work fine on
��your Ataris.

No (I bought one once :-(), some HP-Deskjet called "Windows-optimized"
or something like that are NOT PCL, only Windows can print with it :-(, not
even Mac or unix (or even DOS without windows !) :-(

Here are the jumper setting

first you have to figure out the socket bank

look at it with the 6 sockets on right hand

```
                                 -bank 1-------SIMM------------
                                 -bank 1-------SIMM------------
    -bank 1-------SIMM------     -bank 1-------SIMM------------
    -bank 0-------SIMM------     -bank 0-------SIMM------------
                                 -bank 0-------SIMM------------
                                 -bank 0-------SIMM------------
```

jumper setting

J0	J1	Bank 0	Bank 1
2-3	2-3	4 Mg	4 Mg or empty
1-2	2-3	16 Mg	empty
2-3	1-2	16 Mg	4 Mg
1-2	1-2	16 Mg	16 Mg

SIMM are 30 pin 60 to 80 ns with or without parity 1Mg or 4Mg

Hope it will help

> Regards Bill

Hi Bill

The units ID connections should be the standard one:

```
 1 2 4
 . . .
 . . .
   |
  gnd
```

```
or it could be the other way around! Sometimes the ID connector on cases
are in the usual 6 ...   or  ...
                   ...        .
With a little logic you can usually work out which is which is which!
```

If you get device id 2, no matter what the id selector says, you have
probaly got it the wrong way around.

The led busy light connection can be near the from on the PCB side of
the drive and should be the standard .. type of connection.

I hope this helps.

:Can anyone tell me if a SUN 19inch monochrome monitor part number
:365-1154-01 be used on the Atari TT030? The monitor has a 13W3
:connector....

365-1154   19" grayscale monitor 76Hz vert

Possibly with a graphic card, but not by just adapting the
connector. You'd need an ECL monitor with exactly the same
values as expected by the TT.

Hi Ataristos! :o)

I have troubles with my beloved Atari 1040 ST. It doesn't see my floppies
anymore :O( I mean inserted. What could be possible the problem with it?

I wonder if there is a high tech =:o[ expert over there helping me to bring
back fun to these cold Russian nights?

Yours,

Tsar

My Atari STe isn't quite as stable as it used to be.

This isn't a software problem its definitely hardware.

Occasionally on booting all I get is a rolling screen but after its warmed up left on in this state (lets say a minute) its ok. Other times, in fact most times its fine.

Occasinally in use it will freeze. This is very occasinal and because I've used the software for years I know it isn't the software.

Its not a virus problem either.

So I thought I'd give my STe a good clean up inside and service.

It does have a ICD 16MHZ accerlertor fitted.

Also theres a failed high density drive conversion board inside which I'm going to remove totally. I left it in there as I'd planned to come back to it and have another go but now that I have a floptical drive I don't need a high density drive fitted anyway.

Any advice on what can cause occasional crashes on an STe?

Is 4MEG and an accelerator to much for the PSU especially
when a scsi interface is connected?

Is it simple grime that is reducing PSU performance?

Should I fit a fan and what power point should I use?

Any advice appreciatted.

:BTW: can the +12V power a device that needs 50mA at best
:then? The VideoTurtle uses the Amiga's +12V line to
:eliminate the wall supply through a special cable. That's all I
:was asking about in regards to the +12V line.

Don't even know what this VideoTurtle is?
The +12V in the F030 video connector is
NOT a good source for powering anything
that requires more than a reference voltage.

If you must use the F030 for powering your
VideoTurtle, I'd suggest you open the casing
and tap +12V from one of the blue cables going
from the PSU to the motherboard.

However, why not simply buying a battery
eliminator, or simply a pack of batteries
for this thing? It will be cheaper to do that
that to destroy the PSU and possibly the
motherboard of the F030 as well?

Regards, MG

Hi!

I have my two falcons connected together in a small STinG-network using a
nullmodem cable attached to Modem2. I would like to be able to have a
modem connected to one of the computers instead, while being able to use
the modem from the other computer using the Masquerade function of STinG.

I have to choose between using Midi and LAN. Since LAN is the faster one,
I`m now looking for some info on how to build such a cable that would work
in the same way as the nullmodem cable.

Anyone know anything about this?

Regards

According to Motorola`s User`s Manual about the MC68000, the 8MHz model may be clocked between 4MHz and 12MHz. Outside these values the processor will probably become unstable or not work at all.

I don`t know wether or not overclocking the CPU will negatively affect anything else in the system. Common sense tells me that your three systems will behave the same. The CPU`s of the 1040STfm and STe are not exactly the same though. The STe`s is square shaped, while the STfm`s is rectangular (and an earlier model).

Looks like you've already got two replies with the German www site :-)
The article also mentioned you could e-mail Thomas.Raukamp@t-online.de
and it's on sale in the UK through Titan Designs, www.titan-bss.co.uk
or email sales@titan-bss.co.uk, and System Solutions,
www.system-solutions.co.uk or email sales@system-solutions.co.uk

Sounds good - I think I'll go have a look myself!
Cheers,
Gary.

Hi!

Then I will just use the wall supply unit with the VideoTurtle.

The Amiga allows us to use it's video port as a voltage supply
to eliminate the wall supply. That is why I asked about the
+12V of the Falcon Video Port.

Regards,

Jim W. Krych

p.s. The VideoTurtle converts the TV RGB into S-Video.
I know a "y" cable can be made so my 1CM135 AND the VideoTurtle

can be used at the same time.

I seem to remember reading that some 68000 chips wer actually 68000-16, the 16MHz rated ones, but still clocked at 8MHz.

Anyway, I doubt that it would speed up the computer more than a few percent anyway, because the rest of the board will still be clocked at the good old speed.

There a text file describing a 16MHz accelerator at the following location. Not sure if it's any good, as I've never heard of anyone trying it:

Mine does exactly the same with my SM124. I always thought this was due the monitor, but I recently connected it to my Falcon, and it behaved normally, so it's probably the STE video. I just wait a minute or two for the image to get stable again.

Mine does too, something to do with the keyboard. Sometimes, I boot it up, and it just stays there clicking away like a key was pressed. I just reboot to get it going.

Mine doesn't, but it does have an internal 2.5" IDE drive.

Hmmm, could be a PSU problem. I'll try swapping over my spare STF PSU.

The HBS T-36 clocks a 16Mhz PLCC 68000 at 36 Mhz. I was told that they hand picked the CPU's however for each unit. There is also a 28Mhz version. Both have a CPU cache and dramaticaly improves the performance of the STs. The version that fits in an STE is had to get as there is a special adapter for the PLCC socket. For the ST's, you have to desolder the 68K DILL, install a socket, and the HBS fits right in. It is very small and compact.

Where to get one? Mine just sold, but many dealers in Germany carry them. System Solutions might have a few.

Mike

Yeah... There's a couple of power transistors that are prone to failure after a while. Also, solders around the big choke coil tend to become brittle, because of the high frequencies running through them.

I have a description of that, on my TT030 FAQ, but the repair itself is quite tedious and tricky. I've seen Bernie Diotte do it, though. It's not impossible, but defnitely not meant for the hobbyist.

Bernie's e-mail is on the FAQ.

Just a couple of weeks ago I had a 300dpi IMG of the PCB-layout for the TUW DE600 interface. For some reason I'm now unable to find it, it's simply vanished from my harddrive and every ftp-site I've visited...

Does anybody have this layout or know where I can find it?

Thanks in advance,

Jo Even Skarstein

Check also the connection between the motherboard and the monitor tube. A
few months ago I found that the connector on the board was almost burned
through leaving me with a melted connector. A kind soul (ex-Atari dealer)
has fixed this for me. He just trew away the connector and soldered the
cable to the motherboard. According to him this is a know problem.

This Christmas, I acquired an Atari 520 ST at the rather nice price of 175 SEK (~20 Euro), complete with disk drive and some software. The badge on the case simply says "520ST", but the sticker on the back as well as the RF output reveals that it is an STM. However, this STM has got an odd RF jack. It protrudes 2-3 mm from the case, is somewhat rounded, with a plastic core. Neither the ordinary coaxial cable supplied with it nor any of my usual RCA to coax ones will go into its very narrow entrance. Does this sound similar to anyone, and where would I get a fitting cable?
Oh well, if this doesn't work out, I suppose I'll have to get that SM124 as well...

My mind has been wandering lately about the Atari computers. Does anybody think that Atari will/could be a major competitor with IBM compatible and Macintosh computers again? What do you think it would take for this to happen? I don't know anything about present-day Atari, but is this something that they are likely to do? I know I'd love to see it happen!

Anyone here tried Minix?
Read the FAQ but didn't get a grip on it.
What's it good for? What programs can be
used? Is it a unix clone or what?

OK, I got a bit further, but the IMGs wasn't particularly useful because of
their low resolution. But the PCB was also available in another format, *.hp,
which seems to be just ASCII-files with a long stream of hex-numbers. Does
anybody know which application generates these files?

Not likely. Let me remind that Atari Corp disappeared years ago in the merger with JTS. The only thing left is the heritage, the copyrights that belong to Hasbro, and us

What could happen would be to see a cheap alternative to modern day PCs.
Power without the price. A simple machine priced at 400 dollars or
Euros, with creativity in mind, not just something to run MS Orifice.
The problem is that noone is strong enough to compete against PCs. Next
or Be could have been alternatives, but have failed. The Amiga come-back
seems also to be failing. Apple is Microsoft, and too expensive. Linux
is too "computer-nerdish".

Nick

Doesn't an RCA jack fit ? I always thought they did.

> Oh well, if this doesn't work out, I suppose I'll have to get that SM124 as
> well...

Depends what you want to do with it. Don't forget that high-res and colour are mutually exclusive and have different purposes

Maybe a solution will be the Blackbird project, seen in the new French ACC Magazine :-)

Bye,
/Pascal/

hi all.
TAF has been using a 1991 FaST Technologies board with its Mega4 to give
it more memory and faster speed in producing its club newsletter.
But the FaST board seems to have gone belly up, it only works if you
depress it about a 1/4" midway up the side. i.e. some traces are gone.
seems this is a multilayer board. Does anyone have a contact for FaST
Technologies? Know anyone who can repair the board? Have a newer board
for sale/trade/exchange? Know where you can buy such a board? Does
anyone have any info on this board? thanks for any and all help!
ken

Hi Nick! Well, I agree with most of what you say... However, I think Linux
is -the- future for those who wish to tear down Bill Gates dreamhouse. You
can run it (in some form or the other) on almost every computer platform in

existence. Hard to top that, and its FREE.

Its not that bad, I'm telling you. If I can set it up, than anyone can. (I did have help, but still, it wasn't -that- bad).

So as Linux/Unix grows, (over 7 million users worldwide now), Atari users can benefit from it as well. We just really need faster hardware to run on, in general.

Just my 2� worth... ;-)

It is a UNIX clone of sorts, often used in courses in operating systems theory at universities. Could be fun for experimenting, but is rather limited, at least if you're going to use it as a "normal" OS.

No, that's what's do odd about it. My other, defunct STM had a normal RCA
jack, but this one is something different. The only thing I've been able
to fit into it is a male coaxial connector, but that end is supposed to go
into the TV.

: > Oh well, if this doesn't work out, I suppose I'll have to get that SM124 as

I'd rather have high-res, although I'd like to try out some games, too.
Of course, the SM124 is connected to a 1040STFM, so I suppose that one
should have a proper modulator jack, but I'd nevertheless like to have
another functioning ST, than one just collecting dust (I've already got
one of that kind =).

Atari's only future is in its root as a video game company. Classic software, a perhaps a line of PC/Playstation/Sega/Nintendo peripherals such as classic Atari cx-40 joysticks and a trakball are really Atari's true hope of a comeback. People know and relate to Atari is a game company, only us diehards truly wanted Atari's as computers and the fact that its a PC world. Atari's only chance in the PC world is selling gamming peripherals like joysticks, trakballs, sound cards for gamming and the like, selling PC versions of games, screen savers, classic gamming desktop themes. The revival of the Lynx handheld would be very nice too, its still the best handheld game to date and has a better chance at a second life then the Jaguar.

Curt

It would seem that if we are to learn, from 20 years plus of
hindsight, that the best route for Atari would be limited
hardware releases, as the other gentleman suggested.

Video Games IS/WAS/ AND EVERMORE the bread and butter of Atari.
Classic plus neo-modern with some retro-taste. That is where
Atari can make a comeback.

IIRC - Hasbro - http://www.hasbro-interactive.com/ - owns this part of
Atari.

BTW, Atari r still used in the music industry. Next time u c a studio
on TV look in the corner I bet u will see an Atari ;-)

You are not the only one. The first time I thought: 'what a funny
smell'. Next day opened up and the connector for the coils on the
motherboard was burned in part.
Someone took the trouble to find a new connector, repaired the print
(also carbonated) and it worked again.
A few months later: other monitor making funny screen-jumps.
Same problem, but in time to have no damage on the print.
Now I did it myself: removed the connector and soldered the wires
directly to the board.
I am looking at this monitor now and no problem already for 4
month. Am I lucky!

Met vriendelijke groet,
Ronald van der Kamp

Subject: GEsoft TT RAM Board Jumper Settings?

Message-ID: <77j18m$41l@chronicle.concentric.net>#1/1
X-Deja-AN: 432265969
Organization: Concentric Internet Services
X-MimeOLE: Produced By Microsoft MimeOLE V4.72.3155.0
Newsgroups: comp.sys.atari.st.tech
```

Does anyone have the documentation for the GEsoft TT RAM expansion board? I seem to have misplaced mine.

I need to know:

- the jumper settings for the various memory configurations (actually just
for the maximum configuration)
- and the type of SIMMs supported

Thanks,
Ted

What about the German "Milan", which is available now according to Atari
Computing magazine, running TOS on a 68040. 20 times faster than an ST,
8 x Falcon, 5 x TT they claim. Sounds like it might be a contender?

Hello Stephen,

s> BTW, Atari r still used in the music industry. Next time u c a studio
s> on TV look in the corner I bet u will see an Atari ;-)
But there got fewer and fewer.

At least, even after Atari stopped production, C-Lab produced a better version of the Falcon called "Falcon MKII" (maybe it's been sold even today).

Greetings, Oliver

The Falcon already has the proper RS422 port, so one only needs a

"Mac nullmodem" cable.

Funny you mention this. I've been thinking about recycling old STs
by creating a Russian version of TOS 2.06 with 16 MHz acceleration,
RS-Speed (ie: 34800/57600 modem) and built-in IDE interface.

Then, we could flood the ex-USSR territory with fully upgraded, cheap
machines that can function as Unix-friendly machines (with MiNT) and
capable VT100 terminals also.

It might be monochrome, but even that can be upgraded fairly easily,
if one knows how to program GAL chips.

Either ways, the ST _could_ become the most cost-effective terminal
with built-in mouse support on the planet, if we code the right set
of applications for it. ;-))

Yes.

You could also setup ghostlink or parcp, or use PC formatted 720K disks
if your TT has only a DD drive.

Check out the Quick FAQ

MIDI files are not sound files.

Just use a floppy disk.

There is no "atari format" for midi files, midi is midi.

Another hack, although it was published in the same magazine IIRC (after
all, it was several years ago!)

The hack was called "From 2.5 make 3" and was an attempt to bring into use
one of the 512Kb memory banks that had previously been disabled to install a
2Mb upgrade. My ST showed "holes" in the desktop display which were I think
due to inadequate speed ratings somewhere along the line, although I'm very
hazy on the exact details now.

Hate to spoil the pleasure for you all,
but Atari is as dead as that Norwegian Blue
parrot in the Monty Python sketch.

The most significant feature of the Atari computers was the gui from Digital Research, which was exellent.

As for fighting Windows, it is a good cause, but Linux has a long way to go. A more automated installation would probably do wonders... What normal person knows the scanrates of his monitor? What normal person cares?

This reminds me of a "wordprocessor" for the VIC20 that asked: "How many characters will you write?" Must have been a commie programmer from East Germany?

Unt -vich- karakters vill you vrite?
Ve hav vayz of findzing dat out!
Vell?
Talk! Talk!

Just as I don't expect the VIC in a new reincarnation I can't imagine in what niche of the computer industry Atari would resurface?

Had the company survived at least then there would have been a chance, but as it is now?

The computer aficionado would today probably play with network computing and Linux?

MG

Actually,......

Now I have given this some thought for awhile. And, it may seem funny, but I am dead serious.

You see, here in the US, some company by the name of V-Tech makes a whole line of beginner computers. They even have one with a real simple GUI.

With the new embedded processors, 68306. A "beginner's" computer line could be designed around the ST. LCD panels being much cheaper than they used to be. A whole bunch of products for "beginners" or kids, could be done.

This is food for thought.

For you techs:

The Falcon has a DB19 Male video port. Question:

The Red, Green, and Blue GND can be connected together as a common GND? I see no problems.

The composite sync/video pin-can this be used as a source of just composite sync then?

Does the system know if it is connected to a 15.75KH RGB source?

The monitor I would like to try to hook up has a composite sync
input, plus R,G,B, and GND.

Also, the +12V out, it seems that the GND pins listed, not the RGB
return GND Pins, are for this-correct?

Final question, is the Falcon 030 a noisy machine that
really needs shielded cable-or just smart to use shielded
cable?

Regards,

Jim

I've seen them here. These are toy laptop computers, but the high-end model includes a GUI, a modem and an email program!

They also have one that connects to a TV set, just like the ST, with a GUI and some integrated programs.

Nick

Knowing Atari I woudn't be surprised if R, G and B GND _are_ the same.

: The composite sync/video pin-can this be used as a source of just
: composite sync then?
: Does the system know if it is connected to a 15.75KH RGB source?

Try fetching the DOITF030 archive, it probably has detailed info on the video system.

: Also, the +12V out, it seems that the GND pins listed, not the RGB
: return GND Pins, are for this-correct?

Probably.

: Final question, is the Falcon 030 a noisy machine that
: really needs shielded cable-or just smart to use shielded

I have used a composite signal over a crap audio cable for about a year without much problems (with interlace you won't notice anyway :), although for best quality I would advise a proper cable.
The Falcon is not too noisy as long as you keep the shielding in place.
I had to remove part of it in order to fit a memory extention, so now whenever I turn on my Falcon weirdness starts happening to my radio & TV reception, as my cable runs just behind my Falcon :-)

*** Long post warning *** Mega St and 'accessories' on ebay?

I have TONS of Atari ST stuff that I just don't use, and I guess its time to see if I can find it a good home. I'm thinking about listing the following items on the ebay (www.ebay.com) auctions individually and/or in groups of items. As I haven't run any of this software/hardware in years it will have to be sold as-is.   All software comes with boxes and doc's unless otherwise listed. I got a lot of this stuff when I bought the system, so I've never even run it myself.

Please Email >>>dcard1@stny.lrun.com<<< with any items you'd like to see listed first. As I add items to ebay, I'll post a message to this group to let possible bidders know. Final shipping will of course be the responsibility of the buyer.

Here we go....

Hardware

MEGA ST 2
Mono Monitor
Color Monitor
Monitor Master
85 Meg ICD hard drive (needs new power supply)
360k 5-1/4" external floppy drive
Okimate 20 Color Printer (three black and one color cartridge)

Subject: GEsoft TT RAM Board Jumper Settings?

Hi Ted!

> Does anyone have the documentation for the GEsoft TT RAM expansion board? I
> seem to have misplaced mine.
>
> I need to know:
>
> - the jumper settings for the various memory configurations (actually just
> for the maximum configuration)
> - and the type of SIMMs supported

If you are referring to the Mighty-Mic 32 TT RAM board, I can give you an answer:

jumpers:

j0	j1	bank 0	bank 1	total
2-3	2-3	4 MB	4 MB or empty	4 / 8 MB
1-2	2-3	16 MB	empty	16 MB
2-3	1-2	16 MB	4 MB	20 MB
1-2	1-2	16 MB	16 MB	32 MB

whereas the banks are organized like this (looking onto the board from above, from the front when looking into the TT case:

```
              ************
              ************
************  ************    bank 1
------------------------------------
************  ************    bank 0
              ************
              ************
```

Hope to have helped,

Carsten

I've got a SH204 which I accidently hooked up the 12v line instead of the 5v line from the power supply to the DMA to SCSI adapter. This happened some years ago, but I'm still puzzling over if I can salvage the board and in turn the HD.

The only custom chip on the board is a PAL chip. The chip is an AMD make which has a burn voltage of 20v, but from what I've read a PAL runs at standard TTL levels. So the question I have is, did the PAL survive the trauma because it can handle up to 20v, or was it just as sussceptable as any of the TTL chips on the same board? Also is their a way to test for damage to the chip with a multi-meter? Finally does anyone know if the PAL source is in the public domain?

Later...

Atari Falcon For Sale:

Atari Falcon with 84 meg internal HD,14 megs of RAM,
math co-processor installed, and RGB,VGA monitor adapters,
with manual and box. HD is loaded with all ORIGINAL
Falcon software, inc. Atariworks, plus much more.
Price in USA $650.00 plus shipping/COD.

I also have the external TOAD Syquest 88/44 hard drive,
which was a perfect complement for backing up internal
HD. The Syquest will write to 88 meg carts, and read 44
also.It comes with cable, and 7 - 88 meg carts.
There's a 14.4 ext. modem if needed.
The price of the Falcon and external HD stuff is
$775.00 plus shipping in USA/COD.

If there is anyone in the NYC area, that would be interested
in picking up the Atari Falcon, instead of mailing it, I will include
an Atari SC1224 monitor in excellent working order, for
free.

If interested, please leave Email for Barry Summer at:
bsummer@delphi.com

Happy holidays, everyone!!
Barry

Hi there, I am testing my posting.

I'm a ATARI STe and FALCON user, and a Motorola fan.
Anybody out there, for questions about, par example:
SoundPool's audioprograms, sequencing etc. etc.
Post me!

Guido.

A lot of early Jaz drives had problems, yours might have been old-stock. The

```
problem is IOMEGA have nothing like syquests (RIP) experience with removeable
technology and made some bad design decisions. Early drives and more importantly
early disks are prone to failure, nothing you can do about it except lie to
IOMEGA, not buy their products again and invest in CDR......

Hello

If a guy wanted to install the KAOS TOS image into a Atari Mega ST using
eproms. What eproms would he use 27128? 27256? 27512? 27C10? and
how many eproms would be needed?  The KAOS TOS image file is 197K in
size.....

Any info would be great

I don't think this needs a patch on the STE - just use two 1MB SIMMS in slots 1 and 3 and two of the original 256KB SIMMS in slots 2 and 4.

There was a hardware patch (one of the first articles I translated from German) to use 3 MB in a 1040 STFM (or a 520 STFM upgraded *on the board* to 1 MB), though Derryck found some problems with 'holes' when he tried this.

Regards
/Peter/

It depends on what kind/number of ROMs are inside the ST already, however
I'd go for TOS 2.06 instead.

Hi everyone,

Any advice welcome.

I have been given an SH205 unit but the drive appears shot. Is it possible
to put in a new drive, preferably with greater capacity. What sort of
device is it? IDE compatible???

Anyone who's done this, please write back to me at dennis@dstc.com

Many thanks

IIRC the SH205 is an MFM or RLL device, rather than the SCSI ones that are more
common these days.... you might well have the devils own job finding big drives
with those interfaces...

Hi
My friend, who is not on the internet, has a 4Mb ST520. He wants to upgrade his aging dot matrix printer to a modern ink jet printer, something like a CANNON 250 or 4300 or EPSON similar.

Before buying anything he wants to be sure that a printer driver is available for the ST.

Can anyone help please with:
What is available?
Where can it be obtained?

TIA to anyone who can help.

Peter Wreford

PS. If its a download to my machine - its an Acorn RISC PC.

```

As standard 4Mb (replace the two 256K SIMM's with 1Mb opnes and fill the two spare slots with 1Mb SIMM's) With a MagnumRAM board you can add upto 12Mb of TT RAM, useful if your programs can use it, with a PAK 68/3 I know you can add TT-RAM for use with the accelerator, and this will be the case with the new high-end ST accelerator due out soon. I think a Veloce kitted STe can handle up to 8MB of TT-RAM though it might be 32Mb....I'm not totally sure...

If you use a IDEal STe or a STartIDE E then you can run a pair of IDE devices (you can even use them to get an internal 2.5" drive if you want) and the ACSI port should handle up to seven SCSI devices if you have a decent host such as a Link2/96/97 and decent software such as CBHD or HD-Driver...

I've used six devices with a Link2 and not had problems with them, that was four hard-disks, a CDROM and a tape-drive....

Sorry Peter, but you're wrong this time. On my original STFM I had
2.5 megs of RAM on a SIMM board (512K on board plus 2 megs of SIMMS,
but the STe doesn't allow this without a patch.

Cheers!

James

Hi everyone,

I just got a Canon Multipass C20 fax/copier/printer as a Christmas gift.

Where can I find printer drivers for:
- Cubase Audio Falcon
- Calamus
- NVDI

BTW, will this device print with a Falcon?
AFAIK it demands bi-directional communication, and the Falcon does
not provide this, or does it?

Greetings,
Jan

Hi,

I`ve got a Falcon 030 with Mighty Sonic accellerator and 16 MB RAM + 4 MB TT RAM.
I`ve also got a 3com PalmIII. Communication between them is handlded through
the PilotLink by Rodolphe Pineau, a freeware MiNT/Linux port.

http://www.chez.com/stratos/pilot.htm

For speed I use N_AES 2.1 #970302 which I bought on the Neuss Atari Messe.

Just a few days ago the PalmIII refuses to link with the Falcon.
It did OK for months both under MiNT + AES 4.1 & MiNT + NAES.

I verified with Profile2 system analyser: de default com is now modem1,
it used to be modem2, as it should be. Even if I use SET_DEV7.PRG, wich is
supplied with Profile2 it still stays at modem1.

However, communication with my modem still is fine, faxing & internetting OK.

MODEM.CPX has the out port on modem1 and greyed out (disabled).

auto folder:

```
DRVIN .PRG     3.923 bytes 17.05.94   (HSmodem07)
SCC   .PRG     8.756 bytes 08.06.96
MINTNP.PRG   191.097 butes 25.11.98   (FreeMiNT 030 1.15.1-0.3)
```

work fine

N_AES.CFG

```
.
export  PILOTMODEL=PalmIII
export  PILOTPORT=/dev/modem2
export  PILOTRATE=38400
export  PILOTBACKUPPATH=L:\PalmPilot\Backup
.
```

Could This be a hardware failure?
Can anybody help me please?
If anyone is interested in digging into this, please e-mail me and I will
attach a profile2 report and N_AES.CFG to the reply for analysis.
I haven`t done it now so as not to slow internet down (aprox 85 kB).

Merry Xmas and a happy New Year!

Greetings,
Jan

Hello everyone,

I connected a Trust W95 kbd to my Desktopper Falcon.

The connection is made with a print called Adaptakey,
http://wwwusers.imaginet.fr/~oxo/systems

I use the Adaptakey driver in the AUTO folder like they say, but
for the kbd to work I also have to use Pascal Fellerichos CKBD Deluxe
with the French kbd table. That way it works in TOS, Magic and N_AES.

My problem:
The Adaptakey driver dates from 1994 and so does CKBD.
It is a AZERTY kbd so I use F.KBD.
The top row keys (with the numbers) have two symbols in the lowercase
position and the keys next to "P" and "M" do not print the right keys.

- How do I get ASCII 045 "-" and ASCII 095 "_" to work properly?
  They are next to the BACKSPACE but all I get is "=+" in TOS.

- What about the following characters?
  [] are lowercase right next to the "P"
  {}   under the "9" and "0"
  # and \ are unreachable (lowercase right "3" and ">")

Does anyone have a correct CKBD *.KBD file so I can get to the keys?
Especially BACKSLASH is important for pathnames etc.

Greetings,
Jan

<368d331a.0@news-out2.newsnerds.com>...
:Hello
:
:If a guy wanted to install the KAOS TOS image into a Atari Mega ST
using
:eproms. What eproms would he use 27128? 27256? 27512? 27C10? and
:how many eproms would be needed? The KAOS TOS image file is 197K in
:size.....

The board is configurable for two types of ROM:s,
the 27C256 EPROM which stores 32Kb and the custom
28pin ROM circuit that can contain 128Kb of data.

Your easiest choice is 6*27C256, but you could also
use two 27C010 chips with a little rewiring.

I'd go for the 2.06 version of the TOS though.
This one requires some decode logic in addition to
new ROM:s. You could also go for the successor of
KAOS TOS, namely MagiC, which can be loaded from
the harddrive.

MG

This is an ICD (US) machine and uses 110V. The .5 amp fuse is soldered on the PSU board and appears OK. The fuse I'm missing is the external one between the power cord and the on/off switch . The PSU has what appears to be 3 parallel circuits with a 2 wire take-off to power the ICD adapter. One of the 4pin sockets is for the Adaptec 4070 card and the other 2 are for RLL HDDs . I wasn't thinking, but of course the output of the transformer is DC and the amperage available would be higher. I'll try a .5a fuse. Thanks.

 The cap is a bastard size so I replaced the fuse holder. Just to be

I have a couple of Logitech bus mouses (mice?, pointing thingies) which are suitable for use on Atari by changing the bus connector for a d type. I've been using one of these for years with no problems.

I'll give away two of these to the first two people who want them as long as they pay for postage from Perth WA.

Anybody want one?

No, in the SH205 (in a flat box) the controller takes DMA in and makes from that signals for a RRL-type drive through two cables. No IDE, no SCSI. Try to find another SH205 with a shot controllercard.

You would have been more lucky with an old shoebox SH 204 because in
there is a DMA-SCSI card and a separate SCSI to RRL card.

The nasty thing is: there is not a universal printerdriver. Much
software comes with its own drivers.
So what is he using?
There exists something called NVDI that contains printerdrivers for
printing with help of the then extended system: GDOS printing.
But then again: the sofwtare has to know about GDOS printing.
Most modern stuff that uses graphics does.

How does he uses his old printer and for what?

Nope, this doesn't work. The system thinks it has 4Mb and crashes as soon as it starts using the memory that's not there. Use sysinfo.prg to see for yourself.

There are 2 or 3 patch programs available, but I've found them too unreliable to make a useable system. Much better to remove the 256K SIMMs altogether. You have to choose between 0.5, 1, 2 or 4 Mb.

Nicholas

I bow to the superior knowledge....it is a bummer though....remind me never to
try to fix a dead SH205 :-))....people are always trying to get me to fix stuff,
generally I manage it, or at least find out what's wrong, but I ain't fiddling
with something like that.....

Abingdon Synthesis Projects (that's me folks :-)) sell an interface to connect a serial mouse (Micros**t or Mouse Systems compatible) to the mouses port of an Atari, no driver software required, the Atari thinks it's running an ATari mouse, no need to tie up your modem port.....Also do compatible mice etc....Interface is 19 UKP including postage..

he'll need the latest NVDI, version 5 I believe.
it has TONS of printer drivers! he won't go wrong there.
NVDI is available from any Atari Dealer, i.e. systems for solutions.
do a search on the www for NVDI
good luck bonne chance

Nicholas Bales has a FAQ, also available from Hallvart at
http://www.geocities.com/SiliconValley/Bay/8745/index.html
Atari 520STe can easily go up to 4 MEGS RAM, 30 pin SIMM chips.
there are also accelerator cards that will bump it up to 14 MB I believe.
once you have an ACSI-SCSI adaptor you can put 7 SCSI device on the STe,

hard drives, cd-roms, cd-writers,... HD Driver is a good choice for
a hard driver. you can also get cards that will allow you to install IDE hard
rives in your STe.
good luck.bonne chance

AFAIK there are three drivers.
1)CyRels serial mouse driver commercial(unavailable now I think)
2)FaST clubs MouseTrix, commercial-still available
3)mouse25 shareware, should be downloadable from any atari ftp site.
good luck.bonne chance

:- Calamus
:- NVDI
:BTW, will this device print with a Falcon?
:AFAIK it demands bi-directional communication, and the Falcon does
:not provide this, or does it?

yes, i believe it does. the printer might work, maybe the copier,
the fax will not be available through the printer port though.
hope it is a standalone fax!
you won't find a printer driver for this specific machine, but you should be able
to find a printer driver that will work with it. maybe a previous Canon
printer driver, or does the Canon also emulate an Epson? IBM?
NVDI5 has a ton of printer drivers so that is no problem.
do you have the latest CalamusSL? there are new printer drivers with that also.
Cubase I can't help you with

The Quick FAQ has a direct link to one. You need a DB9 to DB25 adapter for the serial port.

You can try downloading serial driver for your mouse from my web pages. It is

called mouse25.zip, and is located on my "useful programs" page. It is located
about 70% down my main page.
URL is http://probehouse.atari.org

Rgds
William

Your mouse has moved. Windows NT must be restarted for the
change to take effect. Reboot now? [OK]

How do I read PDF-files on a TOS system? I heard about Atari Ghostlink, but can't seem to find any FTP site containing it.

A way of converting PDF files is by sending an email to a "magical" address at Adobe. The email should only contain the URL of the PDF file, something like:

http://www.blabla/gaga/example.pdf

(Don't try that address, it's made up!)

Dutyfully the Adobe computer that receives the file will convert it to either HTML or plain ASCII format and send it back to you.

The address for ASCII (plain text) conversion is:

pdf2txt@adobe.com

And if you prefer the HTML format:

pdf2html@adobe.com

The "Subject" line is to be left empty in your email letter.

There are lots of nice utilities for the HP Deskjet family of printers. A used Deskjet 500 shouldn't cost much. And they do sport both serial and parallell printer ports (Not the newer ones!).

The best advice is to buy something that somebody he knows posesses too.

�Does anyone have a correct CKBD *.KBD file so
�I can get to the keys?
�Especially BACKSLASH is important for pathnames etc.

Normally it's very easy to hack a keyboard driver.
Make a working copy of your file first.

Use your normal Atari keyboard and print out
on a paper how the keys are placed there.
You should use a driver or country code for
your country, if that isn't done by default.

Print out on another sheet what your present
configuration is on the Trust W95 keyboard.

Use a program like KNIFE and search for the
sequence that appears when you press the first
five or six keys on one of the rows of the
Trust keyboard.

My (swedish) keyboard starts with:

QWERTY...

Have an ASCII table handy because you will have
to enter some characters in HEX mode.

Keyboard drivers are mostly a set of tables for
the different combinations on the keyboard:
Normal, shifted, capslocked, alternated.

There are some keys that don't appear intuitially
in the tables, they seem displaced. The key between
left shift and alternate, the key under delete and
maybe one or two more.

It is easy to make mistakes, so be careful and
patient!

Hello Martin,

Try using Ghostscript 5.10. You can print out with it too. I have it running on my Falcon w/ Nemesis, and TOS 4.04.

Here's the address for Ghostscript 5.10:

ftp.rz.tu-harburg.de/pub/software/systems/atari/gnu/ghostscript/gemgs

Also, there's an English resource file with some English Docs at:

http://www.cix.co.uk/~derryck/software.htm

"English Documentation and RSC file for Ghostscript 5.10"

(The Cheshunt Computer Club for Atari owners)

Also, there are TWO versions available. One for the 68000, and one for the 68030, which the Falcon and TT use. If it doesn't work at all, try downloading it again. It wouldn't work at all for me, and finally (after much frustration), at someone else's suggestion I downloaded the entire thing again, and Presto!, it worked. :-)   You will need to manually alter the .CFG file to tell the program where the fonts, etc. are.

Hope That Helps,

Clayton Murray

: fashion, or even 4096 on a STANDARD ST (or 19200+ on STe), any way of
: increasing colours in medium res

That _should_ be possible using the same method as 512 colour display
(ie. palette switching in scanlines). You'd probably get less than
512 colours though, but I guess that something like 8 or 16 colours per
scanline should at least be possible?

: -- or even introducing some greyscale
: to high res mode?

That has been done, usually with a hell of a lot of flickering though...

: Even just four greys. 16 colours in medium res +
: 240-line overscan + your interlace program + a flicker-reducing filter =
: a passable VGA resolution display..!

And no CPU time left. :-) (presuming you'd have enough CPU time to
achieve the above)

By the way, does anyone have some commented Spectrum 512 (and/or 4096)
display code or know where I can find some?

I have Falcon with HSModem/FCC etc and a Hayes Optima 28800. I know that
HSModem maps speeds above 19200 to the low (unused) speeds eg 75B, but
TeddTerm doesn't allow for these low speeds. Can I do anything or is
there a PD comms package that will do?
I intend going onto Internet etc with CAB 2.5 and Zetnet as the ISP,
using their pre setup package (at least its a start and they were
strongly recommended at the '89 show). Any Comments please.
Thanks in advance for your help.

Hello fellow ST enthusiasts!

I have an STF with TOS 1.4 (does it really make a difference which TOS I have?). I want to upgrade my 720k disk drives to 1.44m drives. I've read that some drives won't work because a modification has to be made. Can anyone make it easy for me by telling me exactly what disk drive you used and how to modify/install it?

Also, a miscellaneous question: what does TOS error#35 mean? Perhaps there's a list of error definitions somewhere?

Many thanks,
Andy Blakely

:AIFF files between FALCON and MacIntosh (10 to 100 Mb).
:I have already tried plenty of tricks, but surely not the good one.

In the good old days there was a utility for the Spectre128 Mac emulator that allowed you to read and copy data on Mac partitions.

The most sensible thing would be an ethernet link for the both, shame only that there doesn't seem to exist any for the Falcon...

I've also heard about SCSI networks, but can't say anything specific about that.

Sorry, no concrete tips, but maybe matters you could investigate yourself?

>
I look into an old one here

R4 next to transformer: colors are old it looks like
orange orange brown gold that makes 330 with 5 percent

R8 brown black yellow gold 100 k 5 perc

but on the scheme of Phihong part
R8 200R 2W
R4 10R 2W

So I doubt the old colors.

I've been given an NEC 3.5" floppy drive, model FD1138H, manufactured in
1992. Can anybody tell me anything about this drive?

It has a little interface board that goes with it to connect between a
34 way connector and the drive, because the drive has a 26 way IDC
connector on it.

The drive and adapter board are mounted in a 5.25" housing and there is
another model number on the housing - FD5138H.

The whole assembly is the same height as any of the modern slim profile drives around.

You can probably guess that I'm wondering if this could make a suitable Atari spare.

regards

Steve Rollinson

Check out the Quick FAQ. It links to several sources for this sort of thing, including Hallvard's excellent instructions.

> Also, a miscellaneous question: what does TOS error#35 mean? Perhaps
> there's a list of error definitions somewhere?

TOS error numbers, like bombs, don't mean much to the common of mortals. Most of the time, it's a software problem, like a corrupted file.

Wrong again. When you post to a newsgroup, the least you can do is to check a few days later to see the replies. People shouldn't have to switch programs, cut'n'paste or whatever just because you are too lazy to do that.

I think you should get a quick briefing on netiquette.

Nick

It is a mod for the Mega ST that was included in the SST installation
instructions. It takes noise off the reset line that sometimes causes
problems with the Mega, especially after installing a speeder. I found my copy
and sent it snail mail to Richard.

The RCA jack on the back of the Atari pumps out straight RF and expects a 75-ohm connection. i.e. Take a normal cable TV wire and replace one of the F-connectors with a RCA plug. That's all you need assuming your TV has a normal cable connection.

Hi Steve,

That floppy drive is a 1.44 Mb drive. I don't know about the interface, but I suspect it probably works like any normal PC FDD with that adaptor in place.

This site lists it as a 1.44Mb FDD but doesn't give any further info. You could try to email them to find out specifics on the drive.

http://smartlink.net/~icsds/icsflop.htm

Hope this helps.

Regards,

Clockmeister.

Would it not be a good idea to post the quick
FAQ to this newsgroup periodically?
I've seen it in other newsgroups where it's
posted once a week or once a month.

MG

I used to want to do that at one point, but the text version is over 50Kb, which might not be appreciated by everyone, and even then I'm not sure newcomers will be reading it since most of the frequent questions come up several times a week anyway. Many people post questions before even reading the newsgroup.

What I used to do was post a message to remind people where to find the FAQ, which I stopped doing for no serious reason other than I got bored. Actually, if the message was to be periodically posted, it would be best done with a Unix crontab or something similar.

Actually, I'm in the process of updating the FAQ. I know I've been saying this for a while, but I've had a disk crash just before christmas, so I had to start again. Anyway, the new HTML version will have a more flashy design and will be distributed to the major FTP sites. There will also be an updated ASCII version available.

If anyone has any ideas about new items that could be included, then it's time to speak up!

Cheers,

Nick

If you use StinG, try setting up a TCP/IP link between your falcon
and Mac, using the LAN port at 230400 and a nullmodem cable.

Otherwise, a Z-Modem transfer using terminal software, also using
a nullmodem.   The Falcon's LAN is the same as a basic Mac serial
port, so this should work.

What Atari systems will a Tweety Board work with? Will it work with my STF? Also, what does installation involve?

Thanks,
Andy Blakely

Can anybody tell me how to upgrade my STF (with TOS 1.4) from 1 meg of RAM to 4 meg? There seems to be a lot of people out there with 4 meg of RAM. How would I find those chips?

Many thanks,
Andy Blakely

You should be able to use a standard connection as used with the 2600,
SNES, Megadrive, Jaguar, CD32, ST, Ameaba (oops! Amiga) etc...

You need an upgrade board. In most cases, you'll deactivate the onboard RAM and use one or several SIMMs as new memory on that board.

However, if you have a look at the prices of such upgrade boards nowadays, it's probably cheaper to find a second hand STE, which already has SIMM sockets, plus other extras.

I think it was designed for the STF, but if you don't have the installation instructions, I wouldn't even bother. It's supposed to give you a pseudo stereo output, that's all.

It probably won't work on the STE/Falcon/TT because they already have a
stereo sound system.

I'd recommend that you try Connect '95 or the '97Beta version. Visit my web site, address below, for the English text and RSC file ('95 version only) and follow the link to download the package(s).

Hint - load the connect.num file into a text editor, delete ALL the text and save it back to the same name. It isn't in the correct format for these two releases.

Both will allow you direct access to your Falcon's higher serial port speeds and are compatible with MagiC and NVDI unlike TeddyTerm.

Plenty of Zetnetters hereabouts so yes, go for it.

Oh yes, no worries about your "Anonymous" email address (later posting), many people do this deliberately to try and avoid spam. If you want a private reply then make sure that your address is in the message tho'.

I'd have thought that 5 percent tolerance would be fine, assuming that the
original resistor colour codes could still be read or the resistance values
determined by an ohmmeter.

I think that the questioner wanted the values rather than the tolerances?

Well said Hallvard. I've often felt moved to make the same comment (quoting an entire message with a single line response or, worse still, quoting an entire message with NO reply), but have feared waking the (shhh) sleeping giant T.G.

If all you want is pseudo stereo, then I have an article in a very early Atari ST and Amiga Format which shows how to use all three outputs from the sound chip to do just that. I never got round to doing it myself, but it seems very simple. I can send by snail-mail if you like.

Re. my previous helps with high speed modem use on my Falcon, I am now trying STORM. The HSModem FCC driver correctly maps low to high speeds, but I cannot access the port setting on the modem setting. It is grayed out at 'Modem 1', even though I have set the port to Modem 2 using Serial. As a result, I cannot access the modem at all. TeddyTerm works fine and correctly accesses Modem 2.

I have the following add-ons for an STFM I was given. The non-working mess that sprang into view when I removed the shielding was a monumental lesson in the perils of trying for too much. If any one is interested, then all I want is p&p. Sent as seen.

HD driver kit

Marpet Add-on memory kit

Overscan

At Speed + 286 emulator

Thanks in advance.

Bob King

The board works with the STF's & FM's.

I can't remember what the installation requires, I think it's easy to install.

I have had one up and running several years ago, but it is terrible for samples; so that's sound trackers out the window. The manual mentions that samples are terrible with it. I thnk it was aimed at replacing the lovely sound chip that the ST was issued with!

I wasn't impressed with the board at all. You may be better getting the Monster Stereo or the other Microdeal cartridge, these will only work with some software; failing that get an STE

Hi Bob. I highly recommend that you grab CoNnect '95/97 since it is now free. Its got features and then some-blows STorm right out of the water.

;-)

Hi!!!

Love this machine!

I would like to know:

1.) What program is available that will have a WAV file
played at powerup?

2.) Screensavers for the Falcon?

3.) Would like to have a picture in the desktop background.
Which program can do this?

I have several CD ROMS, including the "All Things Falcon"
CD.

Regards,

Jim

  BNG Play will do this, as will SAM (the System Audio Manager) itself.

->2.) Screensavers for the Falcon?

  Before Dawn, Shon, and Twilight, but you have to register Twilight
  before it works more than 90 secs? (there was an excellant article
  about it in ST+ Fanzine lately)

->3.) Would like to have a picture in the desktop background.

  Not sure about single programs, but most of the replacement desktops like Magic, Neodesk/Geneva, and Thing will allow you to do this..

I'd like to try Connect. What are the differences between the 95 and 97 versions? Are there any known problems with the 97 beta version that would make the 95 version preferable for use on a Mega STe or TT?

Don't use v 97. It's an unfinished beta version.

Atari software for sale:

Here is a huge grab bag of ORIGINAL Atari software.
I believe only 2 or 3 are Falcon Specific. All have docs unless
specified otherwise.
Over 15 programs/games for $50.00, incl. shipping in U.S.A.

Diamond Edge
Diamond Back 3
ICD-Pro Utilities
Image Copy 2
Stalker 3
Word Writer ST
Compo C-Font
Cyber texture
Certificate Maker
DEluxe Paint

View II
Awesome Arcade Pack(Xenon,Blastaball,Sidewinder)
ANM LINK-Falcon
Pinball Dreams-Falcon

These 2 have no docs: Degas Elite and Gauntlet 2.

I really don't want to mail things separately, so I've made the price really low.
If interested leave e-mail for Barry Summer at:
bsummer@delphi.com

THank you!!

Atari Falcon For Sale:

Atari Falcon with 84 meg internal HD,14 megs of RAM, math co-processor installed, and RGB,VGA monitor adapters, with manual and box. HD is loaded with all ORIGINAL Falcon software, inc. Atariworks, plus much more.
Price in USA $650.00 plus shipping/COD.

I also have the external TOAD Syquest 88/44 hard drive, which was a perfect complement for backing up internal HD. The Syquest will write to 88 meg carts, and read 44 also.It comes with cable, and 7 - 88 meg carts.
There's a 14.4 ext. modem if needed.
The price of the Falcon and external HD stuff is $775.00 plus shipping in USA/COD.

If there is anyone in the NYC area, that would be interested in picking up the Atari Falcon, instead of mailing it, I will include an Atari SC1224 monitor in excellent working order, for free.

If interested, please leave Email for Barry Summer at:
bsummer@delphi.com

Happy holidays, everyone!!

Barry

If you don't mind it being separate from the main case the best way is
to beg/borrow/steal and old PC supply. The ST requires around 50 watt.
The PC PSUs are usually rated at >220 watt.

I hate to be vague, but I simply don't know! :-))

I've had no negative reports from users of either versions, "registering"
the '97 version is somewhat easier tho'.

Just bear in mind the point that I made about the connect.num file tho'.

:>Killing the scene because he wants a rom image? Not likely.

Car thieves are killing the motoring scene due to their stealing cars and the actions of insurance co.'s pricing putting some cars out of the reach of potential owners, burglars are pissing house owners and household insurers off due to house breakings, why shouldnt stealing TOS have an effect.

Hello

I just turned on my Atari TT030 / TTm195 and only got a quick faint white flash on the monitor? If I hook a VGA monitor the TT030 works but it looks as if the 19in has gone south. Any ideas on possible fix for TTM195? I would be grateful or a repair shop local in the Southern California area......

Ich arbeite dienstlich immer noch gerne :-) mit einem ATARI Mega ST , der
aber beim Booten zunehmend Hardware-Probleme macht. Ich bef�rchte, da� seine
Tage gez�hlt sind. An diesem Mega ST h�ngt aber eine 350 MB-SCSI-Festplatte,

auf der f�r mich wichtige Daten gespeichert sind.

Privat arbeite ich mit einem Windows-Rechner, auf dem ASH-MagiC PC
(ATARI-Emulator) installiert ist.

Gibt es eine M�glichkeit, die am ATARI-Festplatten-Port extern angeschlossene Festplatte f�r den Windows-Rechner bzw. MagiC PC auf dem Rechner lesbar zu machen?

Es w�re sch�n, wenn mir jemand helfen k�nnte...

Viele Gr��e
Ralf B�deker

P.S.: Antworten bitte per eMail (0233281246-0001@t-online.de), da ich die Newsgroup nicht abonniert habe. Danke!

I have a totally different experience to you...

I have sold Steve a ton of stuff over the past year and in most cases
have sent him the goods before he has paid. I am impressed by his
honesty and his promtness in paying soon after.

I would be inclined to believe him if he says the computer must have
broken in transit... The Post Office aren't that careful even if you
write 'FRAGILE' all over the package - they just don't care and chuck
packages.

Regards
Danny

:Actually, the Megafile 44 has a SyQuest removable SCSI-drive, so it
:should be possible to connect a second drive. But knowing Atari it's
:also very possible that the SCSI-interface in these boxes doesn't
:handle more than one device (like the interface in the Mega STE)...

The ACSI-->SCSI converter in the Megafile 44 is logically the same as in the Mega STE, only difference is that the Mega STE model is an SMD and thus smaller.

Both these interfaces can drive two SCSI devices. The Megafile 44 even sports an extra connector for this, or maybe holes in which to solder in a (male) connector. The connector is simply 2*25 pins which can be bought cheap. On the Mega STE you have to make some modifications, but there are descriptions somewhere on the web.

It is also possible to add parity checking with only one single chip, I posted that one myself a couple of years ago.

It does. Many people here have installed a second drive into their
Megafile 44 or recycled the controller into a SCSI tower.

The Megafile 30 (and 20, as well) has a double row of pins on its
ACSI -> SCSI -> RLL board. Does anyone know what they are there for
and what they do?

Whow! My Mega St4 with HD flopdrive does it. Many times nowadays (modern times) I get here flops from DOS. Those disk are 1.4 Mb and formatted (on DOS) for 720 kb.
The trick is: confuse the drive by sticking some tape over the HD-hole! Then the drive does not think 'ah... 1.4 Mb' but '720 kb'.
The problem does not happen with TT: if disk not readable, 720 mode is tried as second guess with no reverence to the extra hole in de cartridge.

Mr User/voyeur69 (oo-er)

What is your real name anyway?

We know you posted from NNTP-Posting-Host: 195.147.131.137 and thus
are a globalnet customer...

On Tue, 15 Dec 1998 17:10:23 -0000, "user" <voyeur69@altavista.net>
wrote:
>If Steve Stupple is so honest as you would suggest then why has he neither
>returned the Portfolio or paid the requested money for it. Parcel Force

Hmm.. as far as I remember you two had a deal - it was a fair swap. he
owes you nothing as you have the 286?

>said that the computer he sent was inadequately packaged therefore liability
>lies in the hand of the sender Steve Stupple.

When you received the computer did you tell parcel force at that time
about the state of the packaging? If you weren't in and they left the
parcel somewhere - did you inform them straight away that the
packaging was crushed/whatever? Are you suggesting it was because of
the packaging that the computer was broken - so in fact it did get
broken IN TRANSIT rather than Steve sending a broken one.

Your claim, matey, lies with the Post Office.

Out of interest, what values do you place on the Portfolio and the
computer (I guess they are both the same value as it seems you had a
straight swap) - so what price did you set?

Regards
Danny

Firstly may I just point out that I have had 3 weeks of computer hell, my ST is not setup for the internet as I am still sorting the hard drives out. Over the last 3 and a bit weeks, my PC has been a bugger. It has either made reading email impossible, or I've not been able to respond completely etc... I have just managed to get the system working where I can actually read my email, news items, and access my mailboxes; yippeee:)

This has caused me a delay in everything, including being able to arrange to meet someone whom I was unable to contact due to their contact details are hidden in a mailbox. Ah well such is life.

Response 1

In article <753n00$nei$1@newnews.global.net.uk>, user
<voyeur69@altavista.net> writes

>I recently sent an Atari Portfolio to Steve Stupple in exchange for a
>286 laptop computer.

This is true, no problem on this:)

>When it arrived it was broken, allegedly in transit.

At first I would agree that it arrived damaged, I will return to this point later!

>Steve Stupple was then asked to return the Portfolio or pay me thirty
>pounds for it.

I don't think 'asked' was the keyword.

>He has failed to do either. I suggest that if you have any
>dealings with this man you should ensure you have the money or the
>goods off him first.

Fine I have never asked anyone to part with goods without being paid for them first. Many people do actually trust me and I rely on word of mouth, I don't rip people off.

>Anyone else out there had this happen to them.

If there is anyone, then they haven't dealt with me. I've been buying Atari gear for many many years and I've sold a few Atari items. What I do is not a business as the intention is not to make money, although it may be nice once in a while, what I do is a hobby of which I do attempt to make it recover some of the running costs.

I am not going to cover everything here, because I have also spotted another article in this thread and will tackle this at the same time as clearing up some bits. I have most of the email that this 'user':

User <pumptek@globalnet.co.uk> or is it S&J <voyeur69@altavista.net>

Namely: Stephen Hansbro

sent me.

Has anyone else had dealings with this chap?

I have nothing to hide AT ALL.

I do expect that Mr Hansbro to have copies of ALL my mailings to him, I wonder if he would be willing to make available his reasons for not replying to many of my emails!!!!

I would have brought this event to a satisfactory conclusion, if it wasn't for my son going into hospital and depleting my funds. This in turn delayed any possibility to settle this problem, this would have also STOPPED the threat that Mr Hansbro gave me.

It was his threats that started me thinking and looking into things further.

I will continue this in reply to Mr Hansbro other posting.

Response 2

All right Mr Hansbro posted 3 and not the 2 I originally thought.

In article <756550$2j0$1@newnews.global.net.uk>, User
<voyeur69@altavista.net> writes
>If Steve Stupple is so honest as you would suggest then why has he neither
>returned the Portfolio or paid the requested money for it. Parcel Force
>said that the computer he sent was inadequately packaged therefore liability
>lies in the hand of the sender Steve Stupple.

Now if it wasn't to Mr Hansbro threatening me, bad move as I hate
threats, I wouldn't have looked further into this situation. I noticed
something that made me start wondering and feeling suspicious, something
was just not right.

The only email I don't have, unless it's on the Atari, is the one where
Mr Hansbro wrote demanding to know where the laptop has got to.

I am going to show you the email Mr Hansbro posted to me.

On Thu, 17 Sep 1998, TIME 13:32.
Subject: Toshiba Has Arrived
[
}Hi Steve,
}
}cancel that last message. I had no sooner pressed the SEND button on
}the computer when the doorbell rang and it was Parcel Force with the
}computer.
}

}Many thanks
}
}Steve
]

Please NOTE the time, I wish I could get my hands on the first mailing to compare that time as well.

Now is it me, or would you actually open the parcel to make sure everything is in order BEFORE you acknowledge receipt!!! Wouldn't a person open a package and make sure everything is as it should be BEFORE acknowledging receipt!!!!

Now look at the next message:

On Thu, 17 Sep, 1998 TIME: 17:05
Subject: Broken Toshiba
[
}Hi Steve,
}
}I have unpacked the computer and the screen is broken. The glass has
}multiple large cracks across the screen. I have contacted parcel force
}as you said you had despatched it compensation paid, and they require
}you the sender to contact them and they will send you a form to claim.
}I would however appreciate a phone call from you to discuss this. My
}telephone number is [no I'm not that cruel].
}
}Many thanks
}Steve
}
]

Correct me if I'm wrong, but from 13:32 to 17:05 is about 3.5 hours (around 210 minutes). If the computer was broken on arrival, why did it take so long to tell me so? Mr Hansbro was quick enough to tell me it HADN'T arrived! But took more than 3 hours to tell me it was broken!!!

What's more, wouldn't the broken screen make a sound when you moved or was given the parcel? I had a picture sent to me with a glass pane, and I could hear the chink as the postman got out of the van; now that's glass and paper, what would glass and plastic/metal sound like!!!!

Was my mistake telling Mr Hansbro that I had sent it via parcel force compensation paid!

I have people many things here and abroad, as many people reading this will know, I have never had any problems with my packaging. The laptop was packaged with that much padding that I'd expect it to bounce when dropped, in a dead bounce way. I was aware that packaging a parcel too tight can cause added pressure to the contents, even though the Toshiba T3100 case is extremely strong. The parcel weighed in a 8Kg, so I'll leave you to work out where the weight came from.

I contacted Parcel Force and they requested an invoice or something proving the cost of replacement. I did a lot of chasing up going and ringing second-hand shops in a 20ish miles radius along with some computer supplier etc. with no one able to give me a quote on how much it would cost to replace.

All the time I wrote to Mr Hansbro and kept him informed, like this one:

>On Wed, 23 Sep 1998, S&J writes
>>
>>hi there,
>>just wondered if you have heard anything from parcel force regarding the
>>Toshiba computer
>>
>>many thanks
>>Steve
>>

And my response:

23 September 1998 19:11
Subject: Re: Broken Computer
}Hi
}
}I posted the form and am still awaiting their response.
}
}Cheers! for now
}   Steve

To cut this down a little, most of the email Mr Hansbro sent me I replied the same day if not sooner. Unfortunately it seems to take Mr Hansbro a little longer or impossible to inform or even acknowledge receipt of mine!!!! Why????

Like this one, I receive and replied the same day:

[
}On Tue, 20 Oct 1998, S&J writes
}>Hi Steve
}>any news from Parcel Force as this whole affair is beginning to drag
}>on
}>
}>Steve
}>
}
}Hi Steve
}
}I wrote to them a stern letter last week, and to date have not heard
}anything. I agree with you it's dragging on a bit, If they don't get
}their finger out and get this resolved, I will have to consult my
}solicitor etc.. It's already cost me a fortune in petrol and phone
}calls.
}

}I will keep you up to date.
]

Now why Mr Hansbro can't acknowledge or reply to my mailings, I wrote this to him the last attempt (either 3rd or 4th) to get an acknowledgement was on 1/11/98!

[
}Hi Steve
}
}Is there anything else you may be interested in, as they are refusing
}to cough up.
}
}I am trying a do a couple of things:
}
}(1) get a replacement plasma screen.
}(2) I'm looking out for another laptop.
}(3) if you want something else.
}
}I am hoping to see my solicitor and see what they say about the
}situation and may be the media.
}

I expected a reply, or was this too much to ask? As no reply was forthcoming.

I never even got an acknowledgement, just the usual mailings. This is the type I mean!

[
}On Sat, 7 Nov 1998, User writes
}
}>Hi Steve,
}>
}>I think this has gone on for long enough. I agreed to swap the Atari
}>Portfolio for a working laptop computer and unfortunately, through no
}>fault of my own I now find myself with a damaged computer. The
}>carriers except no blame as they think it was insufficiently packaged
}>so I would be grateful if you could return the Atari Portfolio or send
}>me a cheque for 30. I am sorry if you think this is unreasonable but
}>the whole saga has gone on long enough.
>

}Have you changed your email address, as I've written to you several
}times.
}
}The last time I wrote, I mentioned that I was looking for a replacement
}screen for the laptop, or a replacement laptop.
}
}I also asked if there was something else that you would be interested
}in, or wanting.
}
}I have been waiting for while for your reply.

}
}I'll send you the 30 quid a.s.a.p. My son is going into hospital next
}week, and so I will be travelling to and from Swansea all week; plus I
}am expecting a new method of getting a drug into my arm any time, and
}so I will have to attend hospital to have this fitted as soon as it
}arrives. I just hope I can get my son out before that arrives.
}
}Swansea is around 50 miles away, and I'm having to make arrangements
}for my other son. This is going to be costly.
}
}I can appreciate your concern, I am the one that's going to be out of
}pocket with this deal. Everything was suppose to be straight forward, I
}didn't expect Parcel Force to break the computer let alone then
}criticise the packaging. I have spent a great deal of time and money
}complying with parcel force's requests etc. and I will be trying to get
}them to pay for the parcel to get back to me.
}
}I will settle up with you a.s.a.p, if you are looking for something
}else in payment, let me know and I'll see what I can do.
}
]

Still no reply or acknowledgement.

Why wasn't Mr Hansbro informed of the arrangement for Parcel Force to inspect the parcel. According to them they had arrange to inspect it, so why did Mr Hansbro arrange for his son to deal with the inspector?

I must thank Danny, Leigh and many others for their support in response to this.

If anyone disagree with my attitude or can answer some of my questions, drop me a line and let me know.

The laptop supposingly with a broken screen, isn't useless as you can attach an external monitor to it.

Thanks for your post Robert. The reason it has taken me so long to respond is that my Falcon is down ....   :(

I had the foresight to hang on to my old STe (for my son to play games and as a backup for me) so after a bit of reconfiguring I'm back online. All I can say is - I want my Falcon back!!!!

I think it was you (lost some of the thread in the transfer) that suggested my problem might be the power supply. Bingo!! As you might recall, I was having intermittent problems booting up. Finally one day it just wouldn't kick in, so I took the unit apart and checked the power supply as suggested. The 5V side was OK, but the 12V was way down. I removed the power supply and took a look to see if there was any visible damage (leaky capacitors, bad solder joints, etc.) but things seemed to look OK.

I've got an old STFM parts machine, so I took out the power supply, checked the voltages (OK), and reinstalled it in my Falcon. I realize that the Falcon is going to draw much more from the supply than the ST would, but I figured at least I would get something going. Instead, all I heard was a fairly loud buzzing sound coming from the power supply and no power or floppy drive lights on. I immediately shut it down, checked my connections, and tried it again. Same thing.

So, the question of the hour: is there anything you can think of that

would cause a large draw on the power supply (perhaps that is why the
original Falcon supply went down)? Remember I was having
intermittent problems with my video display (ie blank screen) upon
bootup. Does that give anyone a clue as to the problem?

As a side note, I'm tring to figure out if it will be cheaper to
repair or replace the PSU.

Any and all comments are welcome.

Thanks,

Gregg

PS Robert, I guess I'll have to wait until the Falcon is up and
running again before I try out your suggestions above .... =).

**=
*
PRESS RELEASE: Floppyshop, Aberdeen
5th December 1998   Floppyshop To Close Down After Nearly 12 Years
**=
*

It is with deep regret that we announce the closure of Floppyshop on 30th
January 1999. Despite tremendous support from a small section of our
customer base, it became apparent that we simply lacked enough 'active'
customers for us to continue providing a service as we head towards the
Millenium. Before we go, we'd like to give something back to our loyal
customers, some of whom have been with us from the beginning. With this in
mind, we are holding a Closing Down Sale until 30th January 1999. All
customers on our regular Internet mailing list should be receiving details
of this within the next day or two unless they have already done so. Full
details will also appear on our WWW site at
http://www.floppyshop.cyberstrider.org where we're currently having a huge
"Virtual Christmas Party"! It will be on-line from about 3am GMT on Monday
7th December.

Open letters to the Atari community can also be found on the site. In these
we give our thanks to our many friends made over the past 12 years. We als=
o
pay tribute to those who continue to fly the flag and set out our thoughts
for the long term future (and there is a definite future) of the Atari
community. Fellow Atari dealers are most welcome to contact us with regard
to taking over our CD-ROM compilations and/or commercial products, should
they wish to do so. We will be contactable by email. post and telephone
until mid-February.

As not everyone on this mailing list is a customer or even an Atari owner,
we will not bore you with the whole story. Suffice to say, if you are not o=
n
the catalogue mailing list and are interested, check out the Web site.
Journalists in particular are encouraged to do so, as it is not our
intention to suddenly vanish without trace, and any mention (feel free to
reprint both messages in their entirety if you=B9ve got space to fill) in you=
r
respective publications would be very much appreciated.

We would like to thank both our customers and friends (many of you fall int=
o
both categories), for their support over the years. Just one more thing,
Atari computers are not affected by the Millenium Bug, so enjoy the
Millenium while those around you crash!

In conclusion, it is very likely this will be the final message sent out on
the =B3Floppyshop News=B2 mailing list. Goodbye and good luck for the future.

Regards

Steve Delaney and Irene Lamb

g> Thanks for your post Robert. The reason it has taken me so long to
g> respond is that my Falcon is down ....   :(

Hu, sounds not good..
No problem.

g> I had the foresight to hang on to my old STe (for my son to play games
g> and as a backup for me) so after a bit of reconfiguring I'm back
g> online. All I can say is - I want my Falcon back!!!!

That's also a great machine. Somtimes i start my old ST (from 1986)
Works fine, but it's slow :->

g> I think it was you (lost some of the thread in the transfer) that
g> suggested my problem might be the power supply. Bingo!! As you might
g> recall, I was having intermittent problems booting up. Finally one day
g> it just wouldn't kick in, so I took the unit apart and checked the
g> power supply as suggested. The 5V side was OK, but the 12V was way
g> down. I removed the power supply and took a look to see if there was
g> any visible damage (leaky capacitors, bad solder joints, etc.) but
g> things seemed to look OK.

WATCH the rest, BEFORE you remove the psu..

Hm..
12V are for the internal fan and some serial parts. Normaly falcon must boot with only 5V DC. 12V come from a smal regulator on the psu. The regulator looks like a normal transistor. Try to chance this part.

g> I've got an old STFM parts machine, so I took out the power supply,
g> checked the voltages (OK), and reinstalled it in my Falcon. I realize
g> that the Falcon is going to draw much more from the supply than the
g> ST would, but I figured at least I would get something going. Instead,
g> all I heard was a fairly loud buzzing sound coming from the power
g> supply and no power or floppy drive lights on. I immediately shut it
g> down, checked my connections, and tried it again. Same thing.

Ahrg, bullshit.. sounds like a great short circuit or 5 /12 V mistake.
If you start with that you MUST check the psu pinout!

```
Falcon: black =gnd
        red   =5VDC
        blue  =12VDV
```

Any other connecton blasts the hardware..
Also i'm not realy sure with the compatibiltiy of the stfm psu.
(I doasn't have a stfm here)

g> So, the question of the hour: is there anything you can think of that
g> would cause a large draw on the power supply (perhaps that is why the
g> original Falcon supply went down)? Remember I was having
g> *intermittent* problems with my video display (ie blank screen) upon
g> bootup. Does that give anyone a clue as to the problem?

Hm.. i'm thinking..
If the connection was wrong, you blast *anything*
With a paper white screen after swich on there are a lt of problems appears..

```
no ram access (falcon must found a minimum of 2K Ram)
no rom access (bad or destroyed)
combel        (bad or destroyed)
```

Hard to say what's exactly is the point.

Time to insert a testkit and connect this machine serial to another atari with a terminal program.

With a large power surge of the mainboard there are problems with defective parts on the mainboard. Best trick: Put one finger on chip skin..
If you found any chip is realy hot.., that's a broken one.
(Only if you can't touch the chip skin)

(Watch out, cpu, videl are *normaly* have a higher temperature as rest of chips)

OTHER: The STFM psu can't deliver 5V and nearly 3Amps..

(Falcon must have that..!)

g> As a side note, I'm tring to figure out if it will be cheaper to
g> repair or replace the PSU.

The safety way is to replace the unit (psu)
Otherways you must found the original parts. (best way)

g> PS Robert, I guess I'll have to wait until the Falcon is up and
g> running again before I try out your suggestions above .... =).

Well, that's true..
Take this tips, i hope that helps..

Merry Christmas

Regards, Robert

Hi to all,

I have received today PCBs for TOS-IDE upgrade from PCB shop.
It is PCB for card that have 256 Kb (actually up to 1Mb, depending on
the EPROMs used) and IDE interface for connecting popular IDE drives on
ST.
I'm in the middle of writing DIY article ilustrated with some 20-30
photos made with QuickCam during assembly, which should make homebrewing

much easier.
If you are interested, please contact me through email.

Regards,

Branko

Hi,

I just was given a Canon Multipass C20 multi function printer.
It can print BW 720 x 360, color 360 x 360, fax, copy and scan.
IF I can get a driver for it for
- NVDI
- Calamus
- Papyrus
- Idealist

For now it does not react AT ALL to my Falcon. Could it be the
Canon Multipass C2O is just one of those devices that only can
live in a Windows environment (2way communication with Computer)
or can somebody help me to get some Atari drivers for it?

Greetings,
Jan

CyberSTrider are constantly looking at improving ways of accepting payment from customers. We are pleased to pre-announce the acceptance of payment in 'Euros' from January 1999.

The Euro is a welcome addition to our current payment methods - GBP and US Dollars (at no extra charge).

The addition of the Euro outlines our commitment to the customer, by making it easier for you to pay for a service you buy from CyberSTrider. This is by no means the end of seeking for other payment methods. Credit Card, Cybercash and on-line ordering are in the pipeline and will be available as soon as commercially viable.

Further details will be available in January, with all GBP prices complemented with the Euro price.

CyberSTrider has been running for over five years (since December 1993) starting out as a shareware registration site for UK users only. The aim was to make non-UK programs available to UK users in local currency.

CyberSTrider have since branched out in to other countries and various other markets (including PC, Mac and Unix shareware) and other business areas.

Payment Acceptance history:
1993 - GBP prices for mainly UK users
1994 - Acceptance of Int. Money Orders in UKP from Canada (no charge)
1994 - Acceptance of cash in any currency (extra charge added)
1995 - Acceptance of European Currencies via Eurocheque (no charge)
1995 - Acceptance of US Dollar cheques (extra charge added)
1998 - Acceptance of US Dollar cheques and cash (no charge)
1999 - forthcoming - Acceptance of Euros (no charge)

Regards
Danny

Someone can tell me how to connect a Zip Parallel drive to an
Atari 1040 ST . Please .

I have already read the zip faq , and try to install the Hddriver76demo
but this one don't let me configure the zip drive .

So i'm asking if someone can tell me how can i connect the zip drive
to the computer . Please .

For Cubase Audio the Internal/External SCSI drives are O.K.
But for Soundpool's Audiotracker and some other programs
I want to connect a big IDE or EIDE Hard Disk.Is it possible
to make an extension from Falcon's original Atari case to an
external IDE? The IDE/EIDE could take power from an external
PSU because the internal is a bit on the week side.Inside the
C-lab Falcon lies a SCSI Quantum 514MB 2,5".
Thanks very much,Tony.

Sorry but you can't.

HDDriver is only concerned with the SCSI bus - it has nothing to do
with the parallel port.

If you are really serious about this you need to swap the ZIP drive
for the SCSI interface model. (You will also need to establish a
proper SCSI i/f - have you got this?)

You'll need the ROMport->parallelport adapter from Woller in Germany.
This also includes a driver. The URL is (IIRC) 'www.woller.de'.

Parcel Force? the better you pack it the harder they kick it! Receving
things through parcel force that are still intact and working i would
regard as a bouns!!

regard

That doasn't work in the way you think.
You need the  om port interface from  woller/germany

The only way to connect your zip..

Hi

Seasons greetings.

I have an Atari ST FM 1040, Mouse, Mono Monitor for sale

Price $ 150.oo   Pickup only

Ps also do repairs and have other systems.

Leave Email or ring 9 397 7695 in Williamstown Victoria Australia

Yours Ray W____________________

Hi

There is one other option to using the zip drive on the Atari;) and that's connect it to the parallel port of your PC and use GhostLink;)

The FAQ is pretty clear that you CANNOT CONNECT A ZIP DRIVE TO THE ATARI PARALLEL PORT.

You can connect a SCSI zip drive to a SCSI host adapter or a PARALLEL zip to a special cartridge port adapter sold by Woller Gmbh in Germany only.

HDDRIVER doesn't support drives connected to the parallel port and
definitely never will. Additional hardware is required for the Atari
anyway to connect drives to the parallel port. Woller Systems in Germany
sells an adapter for 129 DM or something like that.
Get the SCSI version, this is plug and play and much faster.

Those drives need a printerport.
We have one on the 1040 ST but not of the good modern kind. So no-go.
>
>I have already read the zip faq , and try to install the Hddriver76demo

HDdriver caters for IDE (Falcon-way) disks and many other machines on
the SCSI-bus (or with Link-adaptor on the DMA-port)
>
>So i'm asking if someone can tell me how can i connect the zip drive
>to the computer . Please .

In germany they made a hardware interface for plugging in the ROM-port and making a modern printerport-look-alike.
You also need special software they sell with it.

With PC's it is: more thenm 45 cm cable and it does not work.
for the Falcon I would assume: 20 cm is safe.
This connection is very error-prone and a separate (from the
motherboard) powering makes it still more dubious.

You have already a SCSI working, but I agree: IDE is cheaper.
But beware!!!!
Also: make sure when you buy a IDE-drive that it is a AV-kind.

That works, but you need an adaptor from 2.5" to 3.5" IDE.
The IDE cable from the mainboard thrue the first IDE to the
second IDE can't be longer as a maximum of 40cm.

More doasn't work. With some machines you got trouble with
IDE cables longer as 15cm more!

Falcon IDE doasn't have line drivers!

Regards, Robert

An afterthought:
Also.. just as 320x200 can be made to display 512 colours in a limited fashion, or even 4096 on a STANDARD ST (or 19200+ on STe), any way of increasing colours in medium res -- or even introducing some greyscale to high res mode? Even just four greys. 16 colours in medium res + 240-line overscan + your interlace program + a flicker-reducing filter = a passable VGA resolution display..! Might be nice to experiment with that.

Hi,
is there a way to work with a 33 or 56k modem and a Falcon? Does it
require hardware modifications, is the LAN-port of any use?
Thanks, Joost.

There shouldn't be any problem. The Modem port works fine for sure (remember it's called Modem2 in the system, not Modem1). Not sure about this, but the LAN port should be compatible with a Mac modem cable.

TOS 3.06 in my TT came in EPROMs - did Atari ever ship 3.06 mask ROMs?
It is 512K, so you need 4* 27C010 or 27C1001.

If you currently have 28-pin ROMs in your TT, you will have to change
jumpers to use EPROMs, which are 32 pins.

:Joost Bataille   email: bataille@xs4all.nl

Definitely. No hardware modifications are necessary.
I've run modems on the LAN port. You only need a
MacIntosh-to-modem cable. Ask your friends for such a
cable because many times the modem manufacturer includes
both a cable for PC and one for Mac.

28K8, 33K6, 56K Modems an ISDN-Adaptors work nice on the Falcon.
ISDN-Adaptors only if you use the AT-Mode. no specialy CAPI-Software
for Atari avaiable. What you need as driver is HSModem7. No hardware
modification. HSModem also support the LAN-Port. You need a special
modem cable. Normal Mac modem cable doasn't work!

Regards, Robert

I have a 33.3K modem that I used on a Mac. Will it also work on the TT
using the LAN Port. If so I am going to dig it out as it beats the heck out
of running 19.2

So 3 months later he can replace it with what ?   iMAC2 perhaps?

This crapple stuff is outdated before it's released... USB is a joke.

I have approx 500MB of Atari data on a SCSI 540MB hard drive (which I took out of my broken Mega STE) which I would like to read/transfer onto my MMX 233 PC, via a external SCSI hard drive, SCSI one cable connected to a Future Domain SCSI 950 card (inside my PC) and using a Atari software emulator. I do not have the software drivers for the Future Domain SCSI 950 card but Win 95 has recognised the card, but the nearest driver it has, is for the Future Domain SCSI 850 card. Which I have set it upto and guess what, it found the SCSI 500MB hard drive and put a icon up on the desktop.

So why can I not access the data then via this icon?
All my Xmas card lists, letters, etc are on the Atari 500MB hard drive.

Please can someone help me!

Well... yes and no....

USB seems like a good cross between SCSI and plain Serial port.
The specs are kinda sketchy, but then so was SCSI-1 at first. ;-)

Hi Atarians!

I have an 520 STE which i want to upgrade to 2 mb ram.

I've tried to put in two 1 Mb simm's in the two available sockets but
nothing happened

What should i do?

I see...When a product is not updated it's not outdated?  Is this the Atari
philosophy or being jealous?

If it only had 512kb, you need to replace the 2 256kb simms with the 2
1Mb simms.

Don't forget, memory only works in "banks" on the STe as well. You have to use banks 2 and 4 for 2 1-meg SIMMs IIRC. (make sure you are using the same type/speed SIMMs as well, for the least chance of any probls.)

Content-Description: Microsoft Word Document
Content-Disposition: inline; filename="Software"

Software with original disks and documentation:

Antic Software:
Star Struck the astrologer (will load and work from a hard drive)
Maps and Legends the Cartographer (only runs on old TOS)
Data Map Collection 1
CyberPaint (Pro Animation Studio) from Antic Publishing, Inc.

CAD-3D (version 1.0) [all 3 resolutions]
Human Design Disk (Requires CAD-3D)
Genesis - The Stereo Molecular Modeler (StereoTek Option)
Future Design Disk (Requires CAD-3D)
Fonts, Primitives, Hints and Tips (Requires CAD-3D version 1.0 or 2.0)
3D Developers disk for CAD-3D 2.0
Architectural Design Disk by Darrel Anderson (Requires CAD-3D)

Flash STO220 by Joe Chiazzese and Alan Page (telecommunication package) [medium and high resolution]

The New Technology coloring book (low resolution only and only works with the old TOS)

GFA Artist by Michtron
First CADD by Generic software

WANDERER by Pyramid Software includes two (red/green) stereo glasses.
1st Word with manual (versions 1.01 and 1.02)

Fahrenheit 451 by Ray Bradbury (Telarium)

HabaWriter (reported to be the worst word processor ever for the ST!) It ran properly on my system!

Thunder! spelling checker (Batteries Included) for word processors without a spelling checker. Works better than the spelling checker in 1st Word plus

Oo-Topos for Atari 520ST by Polarware (missing the ships map)
The Crimson Crown (further adventures in Transylvania (Polarware)
Temple of Apshai Trilogy by Epyx
TASS TIMES in Tonetown (Activision
Hacker II the Doomsday Papers (Activision)
Mercenary (Datasoft)
Silicon Dreams (Firebird)
Jewels of /Darkness (Firebird)
Flight Simulator II (Sub Logic) only runs from disk
Revolver (Intersect Software) load two or more programs on a 4 meg system.

Check to be sure that they are truly 1MB would be first on the list.
Secondly what do you mean by two available sockets. Are you leaving the other two filled with 256K simms to give a total of 2.5MB? There should be a total of four simm sockets in an STe.

The other possibility is that the 1MB simms don't work, aren't making proper contact in the socket, or some other such hardware failure.

Also check and see if the simms are made by IBM. They created a non-standard 30-pin simm which wouldn't work with anything else.

Later...

I picked up an St hard drive which I believe is an ICD. It is the shoebox style and has an ICD adapter card and an Adaptec 4070 It has 1 Miniscribe RLL and I plan to add another. My problem is that the fuse holder cap and fuse is missing. While there is a .5 amp fuse on the PSU board I'm sure that the main fuse must have been larger since the miniscribe is rated .7 - 1.5 amps. Doubling that for 2 drives would be 1.4 - 3 amp and the LED and controllers must have used additional power. Does anyone know what fuse was used in this ? I don't want to fry anything if there was any trouble with it.

Also it has a lithium disk battery. What was this for ?

ciao   larry

If the fuse in PSU is on primary side (which most probably is the case) then you are comparing "apples with oranges" and your calculation is incorrect.
Rughly speaking, 0.5A fuse on 220V side enables PSU to draw 220Vx0.5A=110W of power. If PSU has 75% conversion eficiency at full power, that would mean that you can get some 80-85W from it. But PSUs for that kind of things have at least two outputs; 5V and 12V and so two max power outputs that add together to those 80-85W.Actual power division varies, but let's assume that both outputs at your PSU are of equal power=40Weach.
For 5V output that means 8Amps and for 12V some 3.3Amps. Ussually one can draw even more power from one at the expense of the other output to some extent... In practice numbers should be some 30% lower as there is always some spare room between fuse capacity and PSU needs...
I would use 0.5Amp ordinary fuse (not fast) as rated...

Regards,

Branko

Hi,

I`ve got a Falcon 030 with Mighty Sonic accellerator and 16 MB RAM + 4 MB TT RAM.
I`ve also got a 3com PalmIII. Communication between them is handlded through
the Pilot Tools by Rodolphe Pineau, a freeware MiNT/Linux port.

http://www.chez.com/stratos/pilot.htm

For speed I use N_AES 2.1 #970302 which I bought on the Neuss Atari Messe.

Just a few days ago the PalmIII refuses to link with the Falcon.
It did OK for months.

I verified with Profile2 system analyser: de default com is now modem1,
it used to be modem2, as it should be. Even if I use SET_DEV7.PRG, wich is
supplied with Profile2 it still stays at modem1.

However, communication with my modem still is fine, faxing & internetting OK.

MODEM.CPX has the out port on modem1 and greyed out (disabled).

```
auto folder:
DRVIN .PRG     3.923 bytes 17.05.94   (HSmodem07)
SCC   .PRG     8.756 bytes 08.06.96
MINTNP.PRG   191.097 butes 25.11.98   (FreeMiNT 030 1.15.1-0.3)
work fine
```

```
N_AES.CFG
..
export  PILOTMODEL=PalmIII
export  PILOTPORT=/dev/modem2
export  PILOTRATE=38400
export  PILOTBACKUPPATH=L:\PalmPilot\Backup
..
```

Could This be a hardware failure?
Can anybody help me please?
If anyone is interested in digging into this, please e-mail me and I will
attach a profile2 report and N_AES.CFG to the reply for analysis.
I haven`t done it now so as not to slow internet down (aprox 85 kB).
I`ve sent a copy of this msg to Woller Systems & Rodolphe by e-mail.

Merry Xmas and a happy New Year!

Greetings,
Jan

Hi. You don't have to have 4 SIMMs for it to work. 2 1-meg SIMMs will
work as well. They do have to be in the correct slots though... ;-)

The best way is to ask any local electronic store for the right cap.

Otherways, remove the hole fuse holder and fit another (complete) one.
The fuse check with 1 amp, if they blows, insert 1.5 amp but not
more as 2 amp. I doasn't know anything about the internal psu.
.5 amps on the psu looks like enough as primary (120V) fuse.

>don't want to fry anything if there was any trouble with it.
> Also it has a lithium disk battery. What was this for ?

I think this adaptor will have a realtime clock too..
Buffers the time if the drive is OFF.

Regards, Robert

Hmm...I re-read the original post and noticed that the poster said "simm
sockets", not just SIMMs, so if this is what he meant, ignore my post.

Works fine here...

Optimal? I dunno...but it seems to serve to the max...
I use HSMODEM7 and STing to run a modem off the LAN, using a Magnum
28.8 modem as packaged for a Mac, and all is well.

I've not yet figured out how to use the LAN under KGMD however.

Under KGMD, the modem dials, but PPP doesn't negotiate a connection
as it should...a minor problem I'm sure...

And about time too ;-)

I've revamped the site, juggled the Atari & TOS pages around a bit and
updated the links - adding 177 new ones in the process.  There's
hopefully more to come fairly soon, and just in case any Atarians are
into goth music, some Fields of the Nephilim pages are on the way...

Finally, there's an alias avaliable for the Atari & TOS pages -
elysium.atari.org

Happy New Year!

Ashley

An emulator assumes you're using a PC formatted HD IDE or SCSI. It them emulates an cpu/os (atari) to let the PC hardware be used in that enviroment. So, yhe option that's left is to repair your STe, and copy it with PCSlave or somethink similar. Or attach the HD to another ST, and copy it from there :)

Aryan

I use my PortFolio every day ! :)

Hi folks, I was brought up on the Atari 400/800 and have a number of demos that had the Fuji symbol. Some had rotating colors, some were 3D, and some even rotated the entire symbol.

Does anyone know where I could find a large Fuji symbol like that to use as the opening screen in Win95? Or as a screen saver? I've looked all over and can't find one anywhere. Would have thought with the Atari's continued popularity somebody would have ported over a 3D Fuji to the PC.

Any help appreciated. Please remove the "nospam" to reply. Karen

I have a simple Atari symbol screen saver for Win95/NT on my web page. It is downloadable from that site. It is the last item of my list of programs. I will be uploading a new version as stated on my web page (said that about 4-5 months ago :-)), but you can download the original version.

My pages are at http://probehouse.atari.org

Rgds
William

Web site udpating:

After technical problem with our accommodation, our web site was broken. Actually, he is running correctly with many modifications in bonus.

- a page with french and foreigners distributors.
- a page with various links wich claims to grow...
- a quick access to tested softwares on CENTurbo II (163 refenrences).
- a CT2 FAQ in the softwares page of CENTurbo II menu.
- new version of CBOOT 1.0.8, PUTFLASH 1.0.8 + FLASH.BIN 1.0.2, CENTscreen 3.4.0, VIDEOMOD 1.2.0. All from 12/08/1998.
- new version of CENTview 2.9.0 from 11/25/1998.
- new version of CECILE Demo 1.84 form 11/10/1998.
- new version of SANDRINE Demo 3.0 from 05/11/1998 that you can use to really scan but with colorless :-)

CENTurbo II: Available in January 1999

The CENTurbo II revision B is in productions. She will have a new hand-made Fast-Ram controller (same on the Phenix) and more quickly.

A better integration permited to decrease the price to 1890FF TTC !

The serie will be limited, contact your resellers...

Phenix:

The prototype is routing phase according to the last implantation (see Phenix page).

We finish the USB and PCI validation at the moment (hardware and software!).

The DSP+20-bit audio part is valid.

Thanks for your attention.

It sounds silly but try setting the RS232 speed *as low as it will go* and then see what connection speed your modem reports. HSmodem can be set up re-interpret the calls it receives for the low speeds as instructions to speed the port up. On an ST, though, you need to have the port modified to get it to 38400 baud and I found that I couldn't get reliable transfers using ICD hard disk drivers - as I was running a BBS on that ST at the time it was a disaster! I can only assume that there were overheads that HD-Driver doesn't have because the same kit worked flawlessly once I changed over.

Keith

: Or are they all Windows/DOS based?

Yep, STonX was originally written to run in a Unix/X environment (hence the
name: STonX - ST on X). It's a very nice emulator, though not the fastest
one around, plus development has been going slow over the last few years.
I got it to run on my mother's Pentium-75 running Linux 2.1.something,
as well on some of the Sun workstations here at University (it does work
very nicely on an UltraSparc 10 ;-)
You can find it at: http://www.complang.tuwien.ac.at/nino/stonx.html

Do you have your RAM testing at bootup on or off? Also, have you taken out the memory board and looked at the memory IC's?

I don't know the one you mentioned. If it uses SIMMs, check which type of SIMMS you have and preferrably of the IC's on it as well.

Gotta go now (not much time).

Does anyone know of a stand alone program for the ST that will read
Mac disks. Need to resave some data from a Mac format to the ST.

HSModem maps speeds greater than 19200 onto the unused lower speeds, so for
example my Nemesised Falcon will run the serial port at 115200 if I set

CiXComm to use a port speed of 150. Extrpolate to find a suitable speed for
whatever hardware you're using.

A standard unmodified ST's serial port has a max. speed of 19200 anyhow.

Hi,

To save you all the trouble, I have a small program which puts the Atari
into
640x800. Let me know if you want it and I shall email it to you.

As for the Line-A docs, I have a book which covers this stuff but it isn't
for
the faint hearted!!! ;o)

Regards,

Stephen.

That's preset for the Falcom files, Derryk, but I don't think it is for

the ST ones. ISTR that there are three pairs of blank entries that have
to be changed to give you the options. Trouble is, I can never remember
which way round the swap goes, whether it's old speed/new speed on each
pair or the other way round.

Is it possible and feasable to produce an interface for the use
of the PCMCIA. It would open up a new range of possibilities for
the Atari

Hi!

Is there a box available for Falcon uesers to switch
between an RGB monitor AND a VGA monitor? Not for a single
monitor, but two! I have a SVGA monitor, and a
Magnavox 1CM135 RGB monitor.

Thanks for any help!

Regards,

Jim W. Krych

g> machine ;).

Yup, check first if the psu is clean. You must found +12V / +5V
(+-5% Up or Down is nor problem)
Second problem with the psu is the stable power.
Any falcon psu have to deliver both voltages stable imeditaly after
switch on, if not, machine doasn't boot well.

(Mostly some people connect an older type of pc psu's)

But we have the same results with an faulty falcon psu.

g> Anyone got any ideas? My first inclination is that it's a ram problem
g> (it's got the Ram Gizmo board with four 4 meg SIMMs (three chip type).
g> Before I disassemble everything again, I'm hoping to get some
g> suggestions/solutions for this problem. Thanks in advance for any

Second main problem:

If the machine try to boot, we must have a minimum of 2K RAM
If not, machine can't start. (Stack won't be initalised)
Recheck your ram board, try another one.

Check solder points at the oard connectors.

Also the ROM chip must be presend completly. That means you must check
the connection of the chip / plcc socked. (Use plcc extraction pliers!!!!!)
Don't touch the contacts, insert chip again in the same direction!

No ram, no video, it's a simple math example ;-)
(Also the video ram is on your ram board)

Please recheck all points, contact me if you fix the problem. (Or not)

Regards, Robert

A port of 2.8.1 (binaries) which works under TOS, MiNT and MagiC is available on ftp.tu-harburg.de. I guess the diffs are there as well. All versions generates TOS executables, unless you use some MiNT or MagiC-specific features in your code.

If you don't mind, please send it to the above email adress. Does the
program also operate on other (OverScan) resolutions ? If not, i would still
be very interested in the program. How much CPU time does your program take ?
Or is it ajustable ? have you used the HSYNC of the MFP, or the HSYNC of the
MC68k ? I have a manual for the Line-A, but I was wondering if anyone had
some more experience with tweeking the LineA.

Uhm, what kind of floppy disk is it ? If it's a 720k, you'll need Small's ROM-module to get the disk read. If it's 1.4Mbyte, you could use a PC program, that reads those kind diskette's.

Yep it's me again:)

Has anyone managed to get a SCSI PD drive linked up to their ST?

For those that don't know, these are a drive that can read normal CD-ROM's (LUN 0) and read/write optical disks (LUN 1).

It works fine on a PC, but I can't get the bugger working on my Atari.

Any idea's!!!

I know there exist a small utility from DMC that reads Mac floppys.

That's what the German docs says about MacSEE:

MacSEE kopiert Daten zwischen Ihrem ST/TT-System und einem
Macintosh-System. Sie k�nnen sowohl mit Disketten als auch mit
Wechsel- und Festplatten arbeiten. Damit sind Sie in der Lage
EPS- oder TIFF-Dateien auszutauschen und gemeinsam zu nutzen.

I can't say if it works as I never have used it.
Where to find? I don't know. It's probably a commercial package.
It was programmed by Alan D. Reeve (Reevesoft) somewhere in 1992 for DMC
(Calamus) Germany

the package you have can handle it, as can the new Extendos Gold.
In Extendos Gold they also have an installer that has screens for
you to set up the multi changers - but I don't think this existed
in the older version.   Wayne

Actually, I haven't used it on an ST, but on TT and Falcon. It works fine on my machines. I'm using HDDriver 6 as my hard disk driver, and it has support specific for the PowerDrive.

I would suggest that you try different hard disk drivers, and perhaps try pulling or replacing the terminating resistors on the PD. I can't recall whether there are any, but I know that I have to fiddle with these on several of my devices whenever I change configurations.

Since I'm using the PowerDrive with HDDriver, I can also use BigDos and format a PD cartridge as IBM compatible. This means that I can plug the PowerDrive into either a PC (w/SCSI) or any of my TOS machines, and they can all read and write the same PD cartridge.

That is a good point. My Falcon used to do that at boot time, but one day (several months ago), the bootup pattern changed and it no longer does the RAM test. I have no idea how to turn it back on.

I did take off the RAM Gizmo board and reseat it, but didn't re & re the SIMMS in their slots, though I did press down to make sure they were seated properly. I may end up doing that next.

Gregg

Hi to all
I have a Stacy that I have fitted with 4mb , a 248mb HD and T28 accelerator. Everything works a treat until the PSU has to cope with these upgrades and power the floppy drive too. Just as the system looks at the floppy drive the internal PSU shuts down albeit briefly.
Any one out there able to help with bespoke PSU mods please?
Dont ask how long I fiddled with the trackball to motherboard connections only to realise that with the cover off the Stacy and with a powerful light to aid my failing sight, some strange reflections really confused the optics. Never heard of it before - which is why I relate it here. Anyway whilst I am new to this Internet stuff I have had Ataris for years and I must say I am amazed at the support the the lovely old machines enjoy.   Cheers for now Bryan

Reinitalise your NVRAM with NVRESET.PRG from Falcon's disk.
Set all parameter new with BOOTKONF.PRG from Uwe Seimet.

Have a look to the NVRAM part of DOITF030.

Regards, Robert

Hi
I am looking for some sort of manual for Atari Works
Spread Sheet. Was such a thing ever made?
I am trying to make a spread sheet as described below.
I am pretty sure that Works can do it but all the logical
formula entries I try just don't work.I have no trouble
with simple additions etc but it's when I try to get the
prg to look for ,say all columns with horse 7 then add
the bets.
This probably only looks right in a monospaced font.

```
    <-------- Will be about 40-50 colums wide ------>
----------------------------------------------------------
  3  7   3    5    1    7                Horse #
----------------------------------------------------------
  5  6.5 8    7    3    8                Target in $
----------------------------------------------------------
                                                           odds
----------------------------------------------------------
                                                           Bet target*odds
----------------------------------------------------------
```

I need to calculate the individual bets for each column then
add the same horse number's bets together so I know the total
bet to be had on that horse. If a horse wins, the target is to be

returned to a set level for the next race and the ones that don't win have to have the target added to the bet then carried down as the new target for the next race. Ideally the odds should only have to entered into one cell, which is related to it's particular horse number, from which all columns with the same horse number can do their bet calculations.Hope you can help.Doing this on paper for 3 race meetings on Saturdays really keeps you busy :)

Hoping someone can help
Please mail me
BTW if your interested this system does make money :)

Regards
Michael Brown

> Has anyone managed to get a SCSI PD drive linked up to their ST?

I have it connected to my TT for more than two years now and found it to be the most reliable removable media device I ever had since the SyQuest 44 MByte drive. No problem using it, neither in Macintosh mode (only one LUN) nor in PC mode (two LUNs) with HDDRIVER as hard disk driver and SPIN! as CD-ROM driver. I recommend to use the PC-compatible mode with

two LUNs though the Mac compatible mode also works and might be
especially interesting with upcoming versions of SPIN!. It doesn't
matter if you have an ST instead of a TT, this will work in any case.
Note that you can download both HDDRIVER (demo version) and SPIN! for a
test. (Note that SPIN! requires MagiC or MiNT to be installed):

Bright light also affects most mice with their cover off. There are
optical detectors looking thru a shutter wheel to sense motion.

I have here sitches for falcon as follows:
box with cable to Falcon and cable to joystick (for 5V juice).
out go:
13 p atari monitor mono (SM 124/5)
13 p atari color (RGB)
VGA for multisync

coax for composite video

The witch has 3 positions for these (1 at a time can be on).
Further: 1 Tulp for speakersound.

Is this what is needed?
I have a box full of them.
They go away for const of production.

When I got my Mac with MacOS 7.5, it had a utility that allowed it to read and
write PC disks. The 720k PC format is almost identical to the Atari ST. Just
format your 720k diskettes on the ST, and you should be able to use your Mac
to copy the info onto those diskettes.

How about an open call to create a consortium to actually build
a Super Computer technology version of an atari.

I have information about CRAY and Convex supercomputers and they
are just now runing on 100 to 200 mhz cpu. But with sophisticated
design of the compilers and sorftware. Convex is a very respectable
middle design and very cost effective.

Any takers. email to <catbird@airmail.net>

Ok---
some rules....

ATARI st's native mode is DD 720 double sided single density.

ATARI falcons and MSTE can read 144 double sided double density

If the pc writes a 720 image on a 144 disk. No system I have
can read it.

1. for all atari systems.   Format the PC version disk F:720
   (note: mask the second hole for the PC).

2. Only a PC with special software can read an ATARI disk.

3. ATARI disk format is PC 3.3. It has a JSR instruction in
the first byte. A pc will vomit. BUT Atari does not
care what is in the first byte. Just 720k and smile.
PC puts a PC instruction in the first BYTE. That is
The only real difference.

conclusion:

a. format the target floppy to F:720.
b. copy the information into the disk.
c. check it by dir a:
d. take that disk to ANY atari and read it with
TOS.

simple? yes?

josephus

Sure. It's called "User Manual" :-)
Get it from http://www.hisoft.co.uk/atari/bargains/index.html for �30
and receive a free set of program disks as well!
Wonder why you didn't get the manual when you bought the program...

Hi,

I still owns a mega st 4, a megafile 30 and a megafile 44
In the megafile boxes,
- there is room fo a second drive
- there is a sasi <-> scsi converter

Is it possible
- to add a second scsi device in those boxes ?
  what hw/sw is then needed ?
  what scsi address to choose ?

- to replace the scsi device in those boxes with a larger one (60-250MB) ?
  what hw/sw is then needed (format and boot, and ...)?

I think I remembered that the partitions were limited to 32 MB
Is it still the case ?
Is there some later BIOS that can handle more ?

Thanks

Hi

I don't recommend that you use 1.44 floppy disks (the ones with 2 holes) for the Atari, unless the Atari is equipped with a high density drive.

I have lost track of the amount of disks I've had to try and sort out because people have been using high density disks in their Atari's 720k (double density) drive. The data isn't secure!

I would suggest using a standard double density disk (the one with one hole) and format it using any PC format utility, or by using

```
format a: f:720
```

Please remember ALL disks are NOT the same.

If you can cut a second hole on a double density disk, you can actually use then use them as high density!!!!!!

Hi,

I still have my old faithfull mega ST4.
I want to connect in in network with my pc (win ' 95)
ethernet is the choice.
I would like file tranfer (ftp)
Even better would be to use the pc as a much bigger storage room
(with backup !).

Is it possible ?
What is the HW/SW needed ? (PC ant ST sides)
What are the costs involved ?
Where can the SW/HW be found ?
Does it need some BIOS upgrade on the ST ?

- I allready have an ethernet card in the Pc and a UTP hub with BNC connector

Thanks

Easy. There's plenty of stuff.

> ethernet is the choice.

Actually, I don't think it is. There were only a handful of ethernet
adapters built for the Atari, so I don't think you'll find one easily.
There are also some projects in the making, but nothing solid yet.

Until then, I'm afraid serial (19200bps max), parallel or Midi is the
choice

> I would like file tranfer (ftp)

That's possible with MiNTnet or STinG.

> Even better would be to use the pc as a much bigger storage room
> (with backup !).

NFS is available for MiNT, but not for TOS/STinG yet, I beleive. Try
this:
http://www2.imperial.co.uk/home/ben/pc2st.htm

or this:
http://193.190.205.13/Popo/148_pol/Samyn/network.htm

This is all pretty complicated, but since you seem to be a network engineer, you should be able to handle it.

Ghostlink is an easy to setup serial port transfer program that mounts the remote drive onto your desktop. Only serial though, and doesn't multitask on the PC side.

> Is it possible ?

Yes.

> What is the HW/SW needed ? (PC ant ST sides)
> What are the costs involved ?

freeware/shareware

> Where can the SW/HW be found ?

Most software is on the usual Atari FTP sites.

> Does it need some BIOS upgrade on the ST ?

There's no such thing as a BIOS upgrade on Atari computers. You probably mean a TOS upgrade. Not required, but nice to have.

Check out the Quick FAQ for details like that.

Not as standard. The megafile has an ACSI/DMA to MFM or RLL converter.
No SCSI on this beast. Maybe a previous owner would have replaced the
original board by a SCSI host adapter, but if the existing drive is
really the original 30Mb one, then I doubt it's SCSI.

>
> Is it possible
> -   to add a second scsi device in those boxes ?
>   what hw/sw is then needed ?

Normally, you need a SCSI host adapter (available from most Atari
dealers). Your existing HD software should be able to deal with it,
though it is worth upgrading to a more modern driver like HD Driver.

>   what scsi address to choose ?

One that isn't already used. hehe!

> -   to replace the scsi device in those boxes with a larger one
> (60-250MB) ?
>   what hw/sw is then needed (format and boot, and ...)?

See above.

>
> I think I remembered that the partitions were limited to 32 MB

That was with the oooold drivers.

> Is it still the case ?

> Is there some later BIOS that can handle more ?

TOS, not BIOS.

TOS 1.x will handle 256Mb partitions. TOS 2.0x can take 512Mb.

Check out the Quick FAQ!

I owned 2 Megafile 44s. They were the SysQuest drives. Due to constant use, reading and writing the heads just exploded on both drives (Not at the same time though...). I noticed that they were SCSI drives and the board also said ACSI->SCSI or something like that...I replaced both drives with 50Mb SCSI drives and they worked just fine. I also had a Megafile 30. That does not have a SCSI converter. I can't remember if you can have 2 SCSI devices at the same time in the 44. But to replace the device with another drive needs no special software...I used AHDI all the way. I'm not familiar with the partition...Never owned a big enough drive to test it...

Actually, the Megafile 44 has a SyQuest removable SCSI-drive, so it
should be possible to connect a second drive. But knowing Atari it's
also very possible that the SCSI-interface in these boxes doesn't
handle more than one device (like the interface in the Mega STE)...

Yes, it does. Note, however, that it's no good idea to use the ACSI bus
if you have a full-featured SCSI bus like the TT has. ACSI is slower and
quite a lot of TTs are known not to work properly with fast SCSI drives
connected to ACSI.

I would say: keep it simple.
take the Mac. From 680xx CPU to some Power Thing.
What to to with old 680xx code? A interpretor/translater for the
opcodes. It works!
Why not some analogon that is cheap.
For Instance Intel hardware with such a CPU-code translator and TOS
as operating system?

I think you need to pay a little visit to the Quick FAQ.

Get sysinfo.prg to know which TOS version you have.
You can get plenty of LEGAL programs from FTP sites.
You can transfer files with simple 720K DOS disks.
If your ST has a 360K single sided drive, then it won't recognize 720K disks.
I don't know what 22disk is, but there are several utilities to transfer disk image files too.

Nicholas

I have a 520 ST w/ TOS 1.x that have worked faithfully for years, but recently has a problem.   When I access a floppy drive (SS or DS), it does not find any files (no error messages, "0 bytes found"). I've tried numerous disks, including disks that I know have info on them, but I get the same response. When I use a bootable disk, it justs goes to the desktop. The motherboard

```
looks okay.  Any ideas ?  Please help.

Sounds like a bad drive. Time to replace it. You can use a standard PC
floppy drive, but you need one with jumpers or it has to be modified.

Check out the Quick FAQ

...or a Power PC thing interpreting 68xxx code. After working with both Motorola architecture and Intel, I much prefer Motorola - especially from a programming point of view.

Specs for the Atari hardware are available so all of that could be emulated and maybe improved on - like the floppy interface (density detection) and the serial port (speed) and maybe provide true SCSI-2 (and/or UW) and maybe IDE.

Come on, somebody throw a bucket of iced water over me and say it can't be done.

:Atari to read the disk... just puts up that unreadable disk message.

Explain in more detail what you did?

:Should these disk writing programs actually work? Is there any other
way
:of getting the software to the Atari? Is there any programs that will
:copy disk images file-by-file (22Disk style) instead of a complete
:track/sector copy? Is there a config file for 22Disk to support the
:Atari disk format?

The MSA could maybe do the job, since there are both ST and PC versions.
You could connect the ST and the PC through a serial or parallell cable.

:How do I find out what version my Atari's TOS is?

By using some SYSINFO.PRG.

Try pressing the CONTROL+ALTERNATE+DELETE key combination and see if yor
ST resets, if it does, your TOS version is at least 1.4

Take a look at the following. There are several programs for GEM on a PC, including 1st Word, Write, Doodle, etc. as well as different GEM versions and now an installer program.

Visit the unofficial CP/M web site.

Martin Graiter (graiter@SPAMLESSstarmail.com) wrote:
: The other day I was playing with old DR-DOS, it had a version of GEM
: contained
: in the package, ViewMax.

ViewMAX isn't full GEM; the drivers have various calls missing and the Item Selector crashes (the ViewMAX desktop never uses it, so it wasn't properly implemented).

The last full GEM for the PC was 3.01; you can get it (and all the versions right back to 1.x) at:

<http://cws86.kyamk.fi/mirrors/cpm/> DOWNLOAD >> GEM WORLD

: Only problem is that I can't seem to find one single program which would
: run under it?

'Twas ever thus. The website above has Digital Research's programs for GEM, but Digital Research more or less gave up on it about the time Windows 3.0 came out.

: Maybe a development of GEM on a PC platform would be a more realistic
: alternative?

PC GEM is still (at the moment) in the state DRI left it in in 1988. It's a 16-bit program and its drivers don't understand anything better than a VGA. None of the source code has been released; I believe (from various veiled remarks Caldera employees have made on mailing lists) that Caldera have the source code, and are (or were at one time) planning to release a new 32-bit version.

The Programmers' Toolkit has been released; there are ports to Pacific C and DJGPP on my website.

If you want to write a clone of GEM for the PC (running atop Linux, perhaps?) then you have my best wishes :-)

Now, an ST emulator that used PC GEM for its VDI (and even AES?) - that would be an interesting thing to see.

Hi!

I have a question.
I have an Atari Falcon computer, actually it's an Atari Crow, which is a Falcon built into a 19" rack with some enhancements in the sound circuits.
Now I would like to use this system as a MIDI controlled sampler. To be more specific: I would like to have a program which can play sound samples and can be controlled by MIDI.
Could someone tell me which program to use and where to get it?
Thanx in ahead!
Please send replies to f.e.j.holleman@student.utwente.nl

<<snipped>>
Regarding ViewMax:

I believe it was a cut-down version of GEM to pose as the competitor for the MS-DOS GUI Shell shipped with old versions of MS-DOS. Just used as a file manager / shell basically. You can run simple DOS apps if I'm not mistaken.

As for GEM on the PC. I believe it was originally designed for Intel architectures. There were even some GEM versions available for the PC along with software to run on it (mostly all by Digital Research, comparable to the early days of the GEOS environment on PC's - clearly deducted from GEOS for C64). Anyway, Ventura Publisher, is essentially, GEM-based, but I believe it now comes with its own core.

As for MagicPC, I believe there are more little gems out there.. ;-)

:Specs for the Atari hardware are available so all of that could be
emulated and
:maybe improved on - like the floppy interface (density detection) and
the serial
:port (speed) and maybe provide true SCSI-2 (and/or UW) and maybe IDE.

Isn't it so that the essence of the "look and feel" of the Ataris we
think of
is the GEM (Graphic Environment Manager) from Digital Research? The
WIMPS milieu,
the warning signs, the "parameters" input etc.

There have been other OS:es than TOS running on the various Atari
machines,
but almost all have kept the GEM spirit.

Maybe a GEM machine is a better idea than building new hardware?
I know that a version of MagiC exists for the PC, but sorry, I can't
seem to
start liking it. It crashes about and has a repulsive feel (the
Desktop).
(I know that this is blasphemy, but that's the way I feel about MagiC.)

The other day I was playing with old DR-DOS, it had a version of GEM
contained
in the package, ViewMax. Stunning how Atari-looking it all is! There was
even
this lousy filecopy program like in TOS which forced you to swap
floppies 64
times if you wanted to copy 32 files from one floppy to another... :^(

DR-DOS is still supported by Novell or Caldera, the ownership is a bit
murky.
Only problem is that I can't seem to find one single program which would
run
under it? I remember that there was talk about old Timeworks Publisher
being
bundled with GEM for the PC market, but besides that I've only played
with the
two ACC:s (clock and calculator) and watched all the pretty icons...
;^)

Maybe a development of GEM on a PC platform would be a more realistic
alternative?

I've connected a Mega ST keyboard to my Falcon with a switch allowing internal or external keyboard switching. In general this works quite well. One minor problem is that the external keyboard doesn't work properly when the computer is reading or writing from any disk. A bigger problem is that the Magic bootup program wants the internal keyboard only to be there at bootup, if not it just halts. Does anyone know a way around this? Thanks.

Well, such a thing ALMOST exists: PaCifiST runs best on MS-DOS cut down to bare bones and it is basically a 68000-code interpreter. One can imagine a greatly improved (i.e.finished) PaCifiST, emulating other 680XX, emulation going to the deepest deeps of BIOS/XBIOS, instead to GEMDOS level. It would need just a couple of files from MS-DOS, or maybe it might be developed into some kind of boot-code for TOS to run even without MS-DOS.

Making an entire new Atari from scratch would be prohibitively expensive. But a cheap, widely available hardware platform exists: the PC. And a PC box need not run MS-DOS/Windows. A lot of them are very happy running variants of Unix. Some, for very demanding real-time applications, run an astonishing, miniature, lightning-fast, GUI-equipped operating system: the QNX. Therefore a PC for TOS (and a TOS for PC) is an idea that can be realized. For the code-interpreter to be useful, one would have to optimize the hardware configuration for pure speed: because of the size of Atari programs a modest RAM would be sufficient; hard disk can also have reasonable size. Fancy graphic cards would rarely be needed. Just brute CPU power.

Unfortunately, it does not seem that Frederic Gidouin will develop PaCifiST much further.

Cu.

Thanks a lot, all you who posted about GEM!

The question of porting GEM to the Intel platform
is resolved long ago. But apparently no new attempts
are made to develop newer software under GEM today?

It is interesting to note that may people mention
new hardware developments along the Atari lines,
but where are the programmers?

My opinion is that there is no point in thinking
up designs that wouldn't even be comparable with
the hairiest PC:s and Mac:s at least. By the time
the development and testing is done, all the rest
of the world would be running on something twice
as fast, with a voice recognition interface...

However, if you can design a multiprocessor
numbercruncher, and a good OS for it, give us a
ring! And it would have to be cheaper than the
Sun machines. And it would have to contain an
emulator for W95 or W98. Or at the least include
a porting of Microsoft Word...

An interactive porn adventure would probably boost
sales, not that *I* would buy it for THAT reason,
but OTHERS would...   (liar) :^)

In the meanwhile, how about designing a PCMCIA or
PC Card interface for the old ST?

MG

Hi ATARIANS

This senile "old git" requires some help please. First my
set-up.

STFM (4MB) with switchable 1.0/2.06;internal HD drive and module
1440 Modem,TABBY tablet,external DD Blitz Drive,LC 100 Colour
printer and an ATARI 80MB Hard Drive.

I have now been donated a SunCD2Plus CD ROM drive. Brand
spanking new,ie never used and still in its wrappings.

Now the question is what do I need to fit this and how do I
go about it? Please treat the answer as to a "Dummy".

Many thanks to all who can help.

Derek

Sounds if the external keyboard wire is to long. That's the point
if the keyboard will not work properly. Otherways, external keyboard
need a reset while start the machine. (Intialise the keyboard)

Have a look to the hardware keyboard driver in DOIT_ST.
That's only one ttl chip.

Regards, Robert

I am having a strange problem with MINT and my serial port. I installed KGMD on my TT030 and was able to get the slip link up and running through DIP. I have HSMODA07 loaded in my auto folder. I am connecting through my modem2 port to my linux box and running slirp. I can establish a connection and ping just fine, but when I telnet to the linux box and pull up a large directory..after the first line, the text output quits and I have to exit telnet..

It looks to me like a buffer overflow on the serial port, but I am not sure..

If anyone has any ideas, please let me know..

Thanks,
John

No they don't. Like the older STs they only have DMA interfaces which then require an external host adapter such as the ICD Link or Translator.

BTW there was never a Mega STFM! The Mega series were the Mega 1, 2 and 4 which were based on normal STs, and then later the Mega STe 1, 2 and 4, which in addition to normal STe abilities had switchable 8/16Mhz processors.

Cheers!

James

Hello All,

If developers really want to rock the TOS world they should build a system with a PCI motherboard designed for a PowerPC and rewrite Magic to run in PowerPC native mode, then write an emulator to have a virtual TOS 68k machine in a
window.   And why not a virtual DosBox in a window too (doom, quake, heritic, etc. dos games). People want faster computers, but want there old software as well. At some point there has to be a fresh start. I am not a fan of intel cpu's but I don't think any 680x0 chip is going to out perform a 450 Mhz Pent II. Even if it was possible to clock a 68060 at 400 Mhz or more. The 680x0 family has been around for may years and it is an exelent cpu but there are faster newer designs to be implemented. (multiple RISC?)
One of my computers is a 200 MHz Pentium with winblow 95 and I can run the TOSBOX emulator to emulate a 68000 ST at 800x600x16 colors at about 10 times the speed of a standard 8 Mhz STfm That probibly about as fast as a TT (don't flame me, I'm guessing) My 16 Mhz Falcon with 14 mb ram is not very snappy with Magic/NVDI/STing/CAB 2.7 and what not browsing the web by todays standards. I enjoy using the computer though. Anyway, the thought of a PCI based system with a 300 MHz PowerPC running MagiC/Thing in native mode is cool. I would like to see something like this.

Jake

Hi

I've just got my hands on a Pioneer DRM-624X a 6 x CD-ROM changer. It's a SCSI device and uses LUN numbers from 0-6. E.G.. Drive ID=5 lun=0, drive ID=5 lun=1 etc...

How do I get Extendos (v2.4) to enable me to use this drive fully; or is there another package for the Atari ST that would do the job?

Any help will be more than appreciated.

Erm... Regarding the subject title, not sure if you mean a Mega ST or an STFM, which are not the same. Anyway, none of them had built-in SCSI. You need a SCSI host adapter to connect SCSI hard drives.

Nicholas

I've had the same problem as Leo, and I've tried several times. Actually there are a number of sites I've attempted to contact off this newsgroup that don't work for me. I'm using CAB v2.5 with STiK 1.12. Any ideas? Is there perhaps a problem with my Internet provider? Most sites work but.... :(

The whole PowerPC bullshit has been proven uneffective on the Mac.
Running everything in 680x0 emulation mode is counter-productive.

Either ways, the Atari scene has become too small to sollicit some
general re-coding of popular software for RISC-native.

If you really want something with PCI or ISA bus, then buy a Milan.
http://www.milan-computer.de/

Yes it is. The only reason why PC are clocked over 100 MHz is
because those boys in Redmond only produce bloated code that is
too slow to run on decent hardware.

Take something as simple as Everest. The equivalent on Windows
(wordpad) is completely useless on anything less than a 486dxII
at 66 MHz, but Everest is fast and efficient on an ST at 8 MHz.

Hi,

I've made a program on the ST that makes low/med and high rez, double the
vertical size, it also works with OverScan, but I've had this stupid
problem, that the GEM desktop doesn't know it has 800 pixels vertical. So I
get this perfect (Hardware-Interupt) Interlace, but it's half the screen
size cuz' LineA don't know it can go all the way down !
Does anyone here know how to tell the ST that it's got more res ?

Aryan

The problem with the atari.org domain has to do with the InterNic not updating their database. As soon as it's done, the atari.org subdomains will all be working as usual. In the meantime, it all depends on the DNS you're using. Some work, some don't.

Nicholas

Martin Graiter (graiter@SPAMLESSstarmail.com) wrote:

: The question of porting GEM to the Intel platform
: is resolved long ago.

Actually it was the other way around: GEM was ported from the PC to the ST
back in '85. They had to create some kind of MS/DOS clone to get the thing
to run on the ST, which is why they wrote GEMDOS...

: the hairiest PC:s and Mac:s at least. By the time
: the development and testing is done, all the rest
: of the world would be running on something twice
: as fast, with a voice recognition interface...

Indeed. I think emulation is the way to go if you want more CPU power.
Already most Atari emulators are many times faster than a standard, or
indeed an accellerated Atari machine when run on a 300Mhz Pentium II
or faster... It's cheap and you don't have the problem of how to run the
newest Unix/Windows software...
There are various good emulators around, just look at TOSBox, PaCifiST,
WinSTon and STonX (which is somewhat slower than the rest, but at least
it's sort of platform-independant and the source-code is freely available...)

: However, if you can design a multiprocessor
: numbercruncher, and a good OS for it,

Which wouldn't be TOS then, because its buggy and grossly outdated
(remember, it's based mostly on MS-DOS and CP/M!). Some of the TOS

compatible OS'es are nice (MiNT, MagiC), but still a bit of a hack.
Fenix was (and still is) a wonderful idea, but development of most
of the components (XaAES, the kernel) has more or less stalled due
to lack of developers (only fVDI is still alive, sort of).

: In the meanwhile, how about designing a PCMCIA or
: PC Card interface for the old ST?

Go ahead. :-)

Do any of those (or any others not mentioned) emulators run in Linux/X?
Or are they all Windows/DOS based?

Look for "STonX" by Marinos Yannikos (IIRC).

Read the documentation. Each LUN becomes one drive letter, so you would have
D:, E:, F:, G:, H:, and I:. It's a simple configuration ASCII file.

Hello everybody here,

Some years ago, I downloaded a binary gcc package working under
TOS (not Mint) and generating TOS executables.

Does anybody knows where a could find the sources of such gcc
package ? Does anybody knows if it exist a version of this
package newer than GCC 2.6.3 (which is pretty old) ?

Thanks in advance for your help.
Best regards,
Jean-Marie

Hi everyone:

Well, over the weekend my nightmare finally came true. I had been playing around with my newly acquired demo of Aniplay 2.04 (thanks for everyone who helped me out on that) on Friday night, the Falcon was working wonderfully (as it has for the two years I've owned it). Saturday morning I switched on my power button and .... darkness! The external drives all spun up, the power light and fan on the Falcon came on, the monitor power light, but no screen and no floppy drive light. Panic!! I tried rebooting a few times with the same result. Immediately I went over to my son's STe and starting configuring things for the imminent changeover - really glad I kept a games/backup machine ;).

About an hour later, on a whim, I decided to try things again. Everything booted up as per usual ...??? After downloading my e-mail, I did the alt-control-shift-delete cold boot, and back to the same problem. Tried rebooting again several times (with the power switch) and got it going again.

I decided to take the unit apart and look for anything obvious (took it right down do the circuit boards). Reseated any connectors, chips, etc. and had a good look around. Nothing looked burnt, there weren't any connectors that seemed flaky, etc. I put it back together, and the same thing ... intermittently booting up OK.

I opened up sysinfo 8.23 and a very interesting thing showed up. It told me the Total ST/TT ram was 10 megs, when normally I've got 14 megs showing up; the Free ST/TT ram showed up as about 12 megs (this was in ST Hi with no .acc or auto progams loaded) which seemed normal. But how can I have more free ram than the total showing? The other odd thing is when I tried to get aniplayer going again, it came up with a "NO DSP connection" type of message, and then crashed on me. Other applications seem to work OK (although I seem to have more problems in CAB than usual) when the unit actually boots up.

Anyone got any ideas? My first inclination is that it's a ram problem (it's got the Ram Gizmo board with four 4 meg SIMMs (three chip type). Before I disassemble everything again, I'm hoping to get some suggestions/solutions for this problem. Thanks in advance for any help.

Gregg Gorrie

You must solder this lead by your self. Otherways buy a ST/VGA switchbox.

Yup - The CyberDen is now a web site - has been for years - In fact, there's a small Atari ST selection in MIDI Hell here and there under various sections. I retired the ST as my music making device a while back. As for Damned Souls - Wow - Yea, that's pretty raw compared to the new stuff - There are 4 other releases and a 6th is on the way. The last two, Soul Reflection and Scorched Blood are more soundtrack/darkwave oriented - then again, you can hear it all RealAudio at the Xorcist site.

Anyways - Yea, time to get rid of the ST stuff. <Sniff> - I'll never get rid of the Mega-II though - Just like my Apple //e, there's a lot of /interesting/ software on it that, well, any emulator just couldn't give justice to.

I have here the following:
Atari 13p female print soldering (like inside all Atari computers)
Atari Male 13p male cable plug
Atari Female 13p cable plug

Soldering one has to do oneself.

Need one?

Well, I looked at the Hardware Hack page and all hacks related to 68000
that I found involved replacing the CPU with a 16MHz version. Maybe I
missed something? Can the 8MHz processor REALLY run on 16MHz if cooled?
Does anybody have experience with this modification: built it and
used it for some time?

Related to this: how about a 68881 FPU? I have a 12MHz FPU in my Mega
(a home-built board), and maybe this can indeed run on 16MHz? (Motorola's
documentation for the 68881 says that 12.5MHz is the maximum for a 12MHz

chip). I dared not try higher clock, afraid I might destroy the overheated
FPU (in my home it gets pretty hot in summer, about 30 C).

In my experience not reliably, but 10 MHz version does work on 16 MHz.
It depends also on bus loading of CPU, so it is not 100% sure for 10 MHz version
to work well on all ST configurations.

Do you have schematics for that ? I need something readable on my PC in form of
GIF,
JPEG or something like that...

Djordje Vukovic skrev i meddelandet <7364vv$gsg$1@SOLAIR2.EUnet.yu>...

:Well, I looked at the Hardware Hack page and all hacks related to 68000
:that I found involved replacing the CPU with a 16MHz version. Maybe I
:missed something? Can the 8MHz processor REALLY run on 16MHz if
cooled?
:Does anybody have experience with this modification: built it and
:used it for some time?

All the processors come from one production line, then by testing them
individually some are discarded, some OKayed for 16MHz, some for 12MHz
some for 8MHZ. Normative is that the actual capacity is about 20% better
than stated. But it isn't unusual that a circuit can work at the double
or even quadruple frequency, specially on the low-end.

We're talking "work reliably" here. If ureliable work is OK, then
even higher ratios are possible. (But for what purpose?)

The Western Digital (now obsolete) WD1772 FDC, found in the ST series
runs happily at 16MHz, some even at 32MHz, which is used for making
HD diskdrives usable on ST:s.

In theory, cooling is always positive in regards to speeding things up.
In practice I can't say about the MC68000, but the Intel family proves
this by developing more effective cooling all the time.

:Related to this: how about a 68881 FPU? I have a 12MHz FPU in my Mega
:(a home-built board), and maybe this can indeed run on 16MHz?
(Motorola's
:documentation for the 68881 says that 12.5MHz is the maximum for a
12MHz
:chip). I dared not try higher clock, afraid I might destroy the
overheated
:FPU (in my home it gets pretty hot in summer, about 30 C).

I'm curious, what use is a FPU on an ST system? Are there any programs
that utilize it? Commercial programs, that is. Think I'd much rather
have
a DSP in my ST, or maybe two, or three, or...

;^)

Anyone know of any DSP systems for the ST? I've only seen one for the
Mega ST:s slot. It was used as a sound sampler and worked only with
TOS 1.4. The DSP therein was from Motorola, but don't remember the
model.

Don't know much about DSP programming, but they say it can be used for
virtually "anyting", some examples are: graphic processors, sound
processors,
modems, interfaces to the real world, etc.

I have a 4Mb Falcon 030 with a Nemesis accelerator, and I am looking at adding a Magnum FastRAM card to it, so that I can have 8Mb of FastRAM as well as the original 4Mb.

I therefore have two questions, does anyone know anything about this card, and, perhaps more importantly, has anyone used it with a Nemesis accelerator, or any other system accelerator.

Any information about this card, or others like it would be much appreciated. Also any ideas about whether the Nemesis and the Magnum card will be compatible would be much appreciated.

Thanks in advance...

I have a 20mhz 68030 and am looking for an board to fit it to a Mega ST. There used to be a board called PCB that pluged into the CPU slot os an ST and made it go faster than a TT.

I think it was made in Germany and sold in the UK by Atari Workshop.

I have plugged this Magnum card in my Falcon. It works fine. But the former owner of this card sold it to me because he had installed a Centurbo 1 accelerator and it was not compatible with the Magnum. I think you may have the same problem with the Nemesis. Hope I'm wrong.

Hi folks...

right my TT has been sitting on my workbench for a year or two now
doing virtually nothing.

whats the deal with regards to putting Linux on it?

i have a few questions with regard to this:

1 - Can i still run my tos apps? if yes how... do i make a dual boot
disk like i have on my PC (Windows95 and SCO OpenServer)?

2 - Obiously i will want to run X, are there drivers for my Crazy Dots
II video card (ET-4000 based)??

3 - What are the memory/disk requirements? i have 1/2 gig drive (some
is used by my tos stuff) and 24mb RAM (20TT/4ST)

4 - is there any compiling involved?

5 - DOH! just realised... i bet this is all in a FAQ right?

thanks for your time...

mark.. wishing he never sold his F030 all them years ago...

Hi

Does anyone happen to know if any of the above will work with the Atari ST, they are 15 inch monitors.

If they will work will I need a special cable, if so what type, and where would I get one?

It states in the add I have here that it does 1024x768 @ 75Hz FST if that info helps.

Regards Ste

Again, I dunno where I've read this or when, but I recall vaguely reading about a German DIY project that clocked the whole ST system bus at about 12MHz. Now, add in a 68000 at 28 or 36MHz (they've known to exist in some accelerator) along with, say, 1 meg of external cache mem, and I'd say you could have a very compatible and pretty fast system, even compared to nowadays Wintels (not in MHz but in overall performance of your apps)....

Would be interesting.

There are others who are much more knowledgable on this subject than I.
But I'll help as much as I can.

>1 - Can i still run my tos apps? if yes how... do i make a dual boot
>disk like i have on my PC (Windows95 and SCO OpenServer)?

Yes, you can still run TOS apps. I have my system set up so I can
boot Linux from my desktop.

>2 - Obiously i will want to run X, are there drivers for my Crazy Dots
>II video card (ET-4000 based)??

I'm not sure but I believe so.

>3 - What are the memory/disk requirements? i have 1/2 gig drive (some
>is used by my tos stuff) and 24mb RAM (20TT/4ST)

That will all be fine. A 1/2 GB HD may limit you if you like to have
a lot of TOS and Linux apps, so you may want to add another HD.

>4 - is there any compiling involved?

Only if you want to as far as the OS goes. You may have to do some
compiling if there are certain apps that you want, but many of them
are available in binary form.

Hmmm .. you had better wait for more informed info. than I have but I
remember that it was JUST the NEC 3D which was suitable.

Yes, you would need a special cable. I bet Sys. Sols. and TUS do it
but it a fairly straighforward job once you match the pin-outs from
SVGA to an Atari 13-pin DIN.

I've something similar, but it's the red that dims a bit: it may be
for a second or last for hours or days on a "iiyama Vision Master 15"
multisync. The same happened on a previous monitor too, with the same
TT.

Not being an electronics expert, I offer no solutions but would be
glad to learn of any you find.

Charles.

Speaking of 16 MHz upgrades....
I have a Fast Technology 16 MHz upgrade on my Mega ST. Unfortunately,
I don't have the manual for it. The worst part is I don't have the
driver disk that provided a utility to turn the on board cache on.
Thats where the bulk of the speed increase came from.

If anyone is willing to copy these for me, I'd be happy to pay the
cost.
Thanks,
Don Walterman

v> missed something? Can the 8MHz processor REALLY run on 16MHz if cooled?
v> Does anybody have experience with this modification: built it and
v> used it for some time?

Yes, used by me self some years ago a 520ST with 16Mhz clock.
Works fine. I have the machine left here, before i take the
first falcon this machine run 12 hours per day.
(Modem/Fax/Voice answering machine)

v> Related to this: how about a 68881 FPU? I have a 12MHz FPU in my Mega
v> (a home-built board), and maybe this can indeed run on 16MHz? (Motorola's

```
v> documentation for the 68881 says that 12.5MHz is the maximum for a 12MHz
v> chip). I dared not try higher clock, afraid I might destroy the overheated
v> FPU (in my home it gets pretty hot in summer, about 30 C).

Yes, they are right. 68881 create floating point errors if it's overclocked.
Simple buy a 16Mhz type and replace the old one. ( If you have a socket )

Regards, Robert

Funny it is not what I expected that it would be. I guess I
expected more from Best. Glad I have his catalog :)

There is a TOS emulator for X out there, called STonX

Probably not on Linux, but NetBSD/Atari supports all of this.

> 3 - What are the memory/disk requirements? i have 1/2 gig drive (some

Perfectly fine, although 1 GB should be more appropriate for
running multiple OS on the same machine. One partition each.

> 5 - DOH! just realised... i bet this is all in a FAQ right?

www.netbsd.org   and   www.linux.org

both have FAQs about Atari TT/Falcon support.

Try Redmond cable first. pricey but at least you will get a warranty, They still
sell allot of atari specific cables even oddballs like ST to apple II gs monitors!
Redmond made the cables that were OEM for Practical Peripherals when they still
existed   http://www.redcab.com/pages/atari.html
Digi-Key still sells the atari 13 pin din connectors for DIY's. The parts are in
the
free catalog aroung page 80 something
 http://www.digikey.com/

Hope this helps

That's because Wizztronics made that web site for them.
I think they even host it for Brad.

**deleted **

In my second STFM, I have an original 8 MHz 68000 running @ 16 MHz.
It works well. I noticed the speed drops slightly as the ST gets warmer.
Not sure if this is the CPU or the logic (74HCT series).

The drop in speed is small; multiply times drop from 193% to 191% (relative to 8 MHz STFM).

In my first STFM, I replaced the original 8 MHz part with a 12 MHz version & clocked it @ 16 MHz.Used FAST logic to clock this one. No drop in speed & a few %'s increase over the other one.

This has been in regular use for the last five years. no problems.

This kind of overclocking gives low average speed increases, but it's worthwhile, as the modifications are simple.

Overclocking the whole STFM is something I've also tried.
Ran it @ 12MHz for a while. Worked well, but my monitor was unable to cope with the new sync's so I stopped.

A combination of overclocked main board (12 or 14 Mhz, 16 is difficult) plus an overclocked CPU (24/28 MHz) would be really zippy.

Unfortunatly, I don't have the time to try this.

This sounds similar to a problem that a friend of mine had with his monitor. There would be intermittent absences of blue. He found that by thumping the monitor in a particular spot it would come good again (good for the tube :)

Eventually, the blue gave up all together so he opened up the monitor and found a nice dry joint near the heater. Resoldered the joint and all fixed.

>I'm curious, what use is a FPU on an ST system? Are there any programs
>that utilize it? Commercial programs, that is.

There is a point- if you need and use ceratin kinds of software.
Some examples, timed on my home-built 12MHz FPU add-on (MC68881)
with a MEGA ST; Sysinfo reports it as a SFP004 compatible FPU:

* Rotation of a 3D view in DynaCADD 2.0 is speeded up cca 500%;

* All other 2D and 3D operations in DynaCADD are siginficantly speeded;

* Whetstone benchmark in Prospero FORTRAN is speeded cca 400%;

* GEMBENCH reports FP operations (Lattice C routines) speeded 1400%;

I have also heard that Calamus and Pagestream utilize the FPU with
amazing results. Some programming language packages offer alternative
libraries for linking with routines for the FPU.

The conclusion: In "floating-point-intensive" applications, a FPU is of
much help and transforms the ST from a "demo" of what a software might
do into a usable tool. (I can think of some games also that might utilize
this feature to quite an advantage...)

Btw. Maybe it should be mentioned that the FPU can be connected to a
Motorola MC68XXX CPU in two ways:

With MC68020 and better CPUs the MC68881 is connected as a "co-processor"
using the CPU's co-processor interface in hardware and microcode;

With MC68008, 68000 and 68010 the MC68881 is connected as a "memory-mapped
peripheral processor" (with some performance degradation). In this
configuration the "chip select" (i.e. FPU address range) is system-dependent.

cu.

Anyone here heard of TOS 5.0?
Anyone using it?

It's supposed to replace all previous TOS:es
on all ST/STE/TT/Falcon machines.

I'd appreciate any info.

MG

A couple of weeks ago there was a discussion here of problems with connecting a Syquest EZ Drive to a TT. I contributed a bit of over-dogmatic stuff concerning my experience with an ezflyer, saying that termination must be removed from the TT. I think that I should expand slightly.

SCSI behaviour is obviously a bit unpredictable. The experts say that any free end of a SCSI chain should be terminated. The TT chain has at least two free ends, the internal drive and the socket or anything connected to it.

My TT arrived (very much second hand) with both ends terminated. The original internal drive had termination resistors and there were three red-coloured resistor packs in sockets on the main board in front of the SCSI socket on the back panel. Theory says that those red resistors should be removed before anything is plugged into the SCSI socket. In my case practice said so too. The Syquest appeared to work but I was getting lost sectors, unequal FATs, every error that you could think of and a few more.

I found that I could fix the problem either by removing the mother board resistors or by unterminating the internal drive. I assume that the latter method worked because the internal 50 wire ribbon is very short so there isn't much difference in electrical effect between the two terminations.

I also found that the internal drive seems to work without problems with nothing connected to the SCSI socket and the resistors extracted.

Other contributers to the discussion had experienced none of my problems. They may have been lucky, or perhaps the terminating resistors were missing from their machines. There are a few other puzzling aspects to this. First, the TT manual makes no mention of SCSI termination at all. This may be because (to my knowledge) Atari never produced a peripheral device for the SCSI bus and therefore left users of such to be advised by the non-Atari makers. Second, the ASCI/DMA bus is electrically very simlar to SCSI yet termination never raised its ugly head in relation to that original bus. A quote from a Supradrive manual may throw some light on the subject - 'DMA is not as reliable as SCSI when more than two devices are connected to a system or when cables longer than 28" are used'.

AFAIK, there is no 68000 which is spec'd faster than 16MHz.

However, at least 68HC000-16 from Toshiba or Motorola will run fine at 32/36

MHz without even running hot. We did this with a modified Magnum-ST board (36MHz CPU with 0-waitstate fast ram access) - it worked fine, and was actuallty faster than my PAK-3 (68030@36MHz with 2nd-level-cache, but without fastram) - which means that you can do this without cache, and thus a lot cheaper.

Only increasing the CPU clock will not give much performance, unless you also have faster RAM access (either cache or fastram or faster bus clock).

Sure, but even then a TT is faster and very compatible nowadays.

But for pure number-crunching power: no.
I do not wish to stand on long toes of all you Atari freaks (I am also) but my TT is tooo slow.
I do PovRay raytracing. I made a tree. It took 16 hours to render on the TT.
I tried it out on an old 485-50 (laughable slowly for nowadays W-users I know) and it took 2 uurs.
I went to a friend with Super Wind machine (hundreds of MHz). It did the job in 1 hour.

Any comment?

Ok. So it seems that an 8MHz MC68000 will probably work on 16MHz with
a couple of TTL chips added. Now, is there a "standard" way to switch
it fast/slow through software- i guess there is, since there is a number
of those small utilities that do that for the Mega STE, etc. Is some
unused port used (ACIA RTS or something from PSG), or must some memory
address be decoded?

Hijack (viewer/convertor) converts .IMG files into something else. But don't
use it to convert something else into .IMG- is very slow and inefficient.

:With MC68008, 68000 and 68010 the MC68881 is connected as a
"memory-mapped
:peripheral processor" (with some performance degradation). In this
:configuration the "chip select" (i.e. FPU address range) is
system-dependent.

Thanks for the answer!

Couldn't the increased efficiency be achieved by cleaver programming
also? Using lookup-tables istead of real computations for instance.

How come the 68882 is never mentioned as FPU to the 68000?

Hi,

I have a Supercharger (PC emulator for ST using 8088 board) which I have been upgraded its software for several times from the early released Version 2 to the Version 4.1.

There is a newer release than Version 4.1 availabled but before I could order the new upgrade. Beta Systems Company was out of business.

Any Supercharger user willing to sell me the 'last version' of these software?

TIA,

Suthipuntha

Hello, I have a Dover Research ALBERTT video card in my TT030. This video card is supposed to be just like the ISAC card. It does 1024 X 768 at 16 colors. I was wondering if this card could do anything else...I would really like the card to do 800 x 600 at 256 colors. I was also wondering where I might find some drivers for this card, I have the 1024 x 768 driver,but I don't know if there are any other drivers or diags available.

Thanks,
John

If you can't find a used SM124 or 144 then you can always use a normal SVGA in B/W applications. (If you can find a monochrome SVGA, even the better). You need only a suitable adaptor to connect the monitor's R, G and B to the ST's mono out, and the sync signals respectively. The pinouts can be found, as always, in Nicholas's excellent http://quickfaq.atari.org.
If you are not at home with soldering, ask a tech friend to do it, very easy if you know how to solder, impossible otherwise :-) . Connectors available at Maplin.

Markku

Have you tried it on a native (means: non-upgraded) 040 and a 060 machine also?
I agree number crunching is often a bit better suited to multi-MHz Intel-compatible processors, but what about bus efficiency and _OVERALL_ performance (which was what I was talking about). The original PC ISA spec was clocked at 8MHz and 16 bits wide. EISA was the same but at 32-bits and mainly used in Compaq Proliant servers and such. There were "overclocked" varieties of this system bus at 10 and 12 MHz but I've seen no further (sort of like the old ST's - they could be made to run at 12 if I'm not mistaken). Then there was VESA Local Bus which essentially let all hardware run at the same speed as the systems main CPU, which puts great demand on the hardware you attach to it, but is also VERY fast. Then there's PCI, 32-bits wide and expandable to 64-bits, with a fixed range of rates, making things easier on peripheral manucafturers while still being a lot faster than ISA.

I think a 060 is more likely the CPU that should be compared to Pentiums and compatible CPU's, the 040 to 486's and the 030 and 020 to the top and lower range 386 processors. The 68000 and 68010 IMHO, should be placed somewhere between the 286 and the 386. Also mind that the TT is pretty old. The 030 was introduced by Motorola in 1987. The 386 I don't know but I think it was pretty late. I've seen 286's around 1986 and it's rumoured that the 68000 was around 1979!

A T800 comparison would also be nice.. (compare to multi-processor Pentium system, and see the results).

And then there's the DSP in the Falcon. It's such a shame that everyone merely uses it for real-time sound FX which could be pre-recorded for most purposes (for games anyway), while there's so much more potential to this little gem as to what you can do with it... I always imagined on-the-fly datacompression using the DSP or using it as a software modem and such.

Is that how the commercially available T-28(E) and T-36(E) accelerators
worked?

Provided that the fastRAM is affordable. If memory is expensive, I'd say
cache is cheaper because it allows you to use slower memory. But you're
right. For pure performance an optimized CPU/memory access/system bus
combination is best.

Sorry, don't have that. Perhaps it's compatible with other external cache
control apps for different accelerators. Have you tried those yet?

It's not quite as simple as this, Uwe.

This TT has an internal (terminated) Seagate HD.

I connected my box full off additional SCSI devices (HD, streamer,
CDR) to the TT's external SCSI port and terminated the last (streamer)
device on the external chain.

This configuration will only behave if I leave the TT's external bus
terminator connected!! If I don't I get loads of 'SCSI Fehler'.

In theory no signals should get beyond the internal terminator and
onto the external bus. In fact it's the only thing which works!!

It has something to do with the TT's T-configuration for the SCSI bus
but I don't understand it at all.

GEnie has v1.5 of albertt.prg, but there's no mention of an extended 256-color mode (that's probably asking too much of the hardware). The file's description does mention, though, that renaming the program to 640X480.PRG will yield that resolution; probably the same for 800x600. Also mentioned is that the 'count Gals and OSC' have to be changed (whatever that means) to achieve these lower resolutions. If you're interested, I can download a GEnie archive of AlberTT-related messages.

Never heard of it. Milan Gmbh is supposed to be developing a 5.0, but
it's probably Milan only. There was also a 4.92, but it was a developers
version, and VERY unstable.

As with many things, size doesn't matter ;-)

What does matter are the horizontal and vertical scan frequencies. If
it's a VGA monitor, then it will only be able to display ST-High res.

Check out for details of resolutions and frequencies in the Quick FAQ.

> If they will work will I need a special cable, if so what type, and where
> would I get one?
>

You'll need to build an Atari 13pin DIN to VGA adapter. You'll have to
find one of those 13pin DIN connectors, which are hard to come by, but
not impossible. Check out electronics catalogs or Best Electronics in
the US.

Re Uwe's point - yes the correct settings worked for me, which is gratifying, but a slighlty incorrect one (TT resistors in, drive unterminated) did too.

Re Roger's point - passive terminators as on the TT port are only pull-up resistors. They don't prevent a signal getting past them. They are supposed to dampen reflections of the signal at each end of the bus. My CD-rom drive arrived with internal termination on the drive itself and an external plug-in active terminator. Either (but not both) seem to work equally well, even though using internal termination leaves a few inches of 50 wire cable to the second socket on the drive overhanging (cantilevered?) past the termination.

Roger, forgive me for asking, but are you certain that your Seagate is terminated?

David

Anything TT-related you could fetch out of there would be welcome.
Scott Sanders and a few other developpers used to upload everything
there, but since Genie is a private network, there's no option for
us mere 'Net users...

Ooooer :-/ I don't suppose I could swear to it, hand on heart, David, but I finished my termination-permutations firmly convinced that the only peculiarity was the necessity of leaving the TT internal bus terminators ON. Must have a look next time I'm under the bonnet.

I guess part of my problem may be that I do not have very effective termination at the end of the external chain - its just the passive resistors in the streamer. I should really think about fitting an active termination, I think.

It sounds like you've been looking in the wrong places. The games you
are referring to are all pirate stuff.

If you want legit games and applications, you have to look for
shareware, freeware or commercial stuff. The best word processor at the
moment is Papyrus, but is commercial. There are share/freeware programs
on most FTP sites.

There's a list of FTP sites here:

There are over 35,000 files. 'TT-related' covers a lot of ground. It's
best if you make specific requests, otherwise I wouldn't know where to
start.

Well, the "Holy Grail" would be a program that would allow those of us
running unmodified TTs to get rid of the white border around the
usable screen in TT Medium on an SVGA monitor...

X-Deja-AN: 416048144
Organization: It's around here somewhere...
Newsgroups: comp.sys.atari.st.tech

I've been reading the SCSI related posts here, but they don't seem to
help.

I'm trying to replace my Quantum 105S with a Quantum Empire 1080S, and
I can't manage to get the drive recognized. Here is how I have it
configured:

  TE: OFF - Termination disabled
  EP: ON - Parity checking enabled
  WS: OFF - Wait Spin disabled
  SS: OFF - Self Seek disabled
 J13: OFF - SCSI termination power from host

```
  A2   A1  A0
  OFF OFF OFF   Should be SCSI ID 0
```

Any recommendations?

I notice that it was mentioned that both the internal and external
chains might have to be terminated. Should terminate? If so, what do
I use for a resistor pack? (two were supposed to be included, but I
bought it second hand).

Thanks,

Terry

Terry,

As the drive is internal, it should have termination enabled.

I assume that the resistances of the TT mother board are still in
place.

But the first question to ask is - "Is this a Quantum which requires
bus arbitration?" My internal drive is a Quantum Fireball and I have
to have HD Driver on my external drive (a Syquest exflyer).

This may not help, but the resistor packs in my defunct Connor measure
120 ohms between the supply pin and the signal pins. The TT mother
board resistors seem to be 100 ohms.

Indeed. Good start.

But to answer Neil's question, isn't there a TT directory on
GEnie's Atari archive? Could you retreive an Index and post
it here? It would be much easier for us to pinpoint usefull
stuff, then... ;-)

The Quantum Empire requires initiator identification, i. e. a driver like HDDRIVER. Initiator identification means that the computer must have its own unique SCSI ID. Note that you won't be able to boot from this drive. HDDRIVER recognizes it if you enable initiator identification in the driver but TOS won't see it when trying to read the root sector during the boot phase. In other words: This drive is fine as long as you have an appropriate hard disk driver but you are not able to boot from it.
There is one exception to the rule: If this drive is connected to an ST/STE with a LINK96 or LINK97 host adapter you can boot from it. This is because these host adapters have hardware support for initiator identification on SCSI ID 7.

Apps= Integer
Raytrace = Floating Point

68030 @ 33/66 Mhz = good Integer, you get nice smooth running APPS

But the FPU-performance is still bad. You'll need tweaks like an extra FPU-card or the DSP doing some FPU-stuff. [see:Falcon DOOM-clone etc.]

Would this also be why the Iomega 100meg ZIP drive won't boot on
my falcon? From a cold start (flip power on) it won't boot but
after it dumps me to the lowrez desktop if I hit the reset button
it then boots. I installed HD driver 7.55 on the ZIP.

There's no TT-specific directory on GEnie, although I've seen a few
German FTP sites with such directories. All the files in GEnie's library
have keywords, but aren't always reliable during searches because of
exclusions.

I'll e-mail you the search results using 'TT' as the keyword. It's a
rather large file so I won't post it here.

That shouldn't do much of a difference. Checking if the internal drive is
terminated is much more relevant ;-) as without external hardware it is
well possible that unterminated hardware inside works flawlessly.

Cheers Peter

Thanks Uwe (& David)

Well, I was planning on purchasing HDDRIVER anyway, but this throws a
minor kink into using this to replace my internal drive. A couple of
other questions then (I really don't have a lot of experience with
this TT yet):

1 - I know that on my ST, I could build a Y-cable to power two
drives. Does the TT provide enough power for me to do so with a
ProLine 105S & and an Empire 1080S? Or will I have to track
down a power supply for it?
2 - If I do install this internally, understanding that I can't boot
from it, can I boot from my Syquest ezflyer 230?

Terry

Terry,

Yes you can boot from a Syquest - I do it all the time - well nearly all.

One feature of booting of the replaceable media is that you can play games with drive allocations. Normally my C drive is on the internal drive, but I have a Syquest cartridge set up for Mint (which I don't use much) with a small C drive and a Minix partition, so the Quantun then starts at E

Is it possible to connect a standard IDE HDD to an Atari STe?

Any wiring diagrams etc would be usefull.

cheers

I think your'e refering to the PAK, its more than just a PCB enabling a 020
to be used, its also got an 030 option with a re-worked 32 bit TOS, fastram,
FPU and other enhancements.

 Regards from STEve & his nice warm cosey PAK'd MegaSTE.

Only one hour improvement from 486DX@50 to Pentium something at HUNDREDS of
MHz????

That's bad..
But: you should compare the TT (68030 + 68882, both at 32MHz, systembus at
16MHz) with a 386DX with added 387DX (preferrably with same speeds for CPU
and system bus, although most 386 systems were still ISA systems restricted
to 8Mhz or 12 MHZ in optimum circumstances) I think. (At least from a CPU
standpoint).

there are a couple of ready made things that will let you fit a 2.5
ide inside,tos 2.06 is needed to boot from ide,so unless you really need
an all in one machine the interface + tos 2.06 is more expensive than
a scsi host add to this the scsi will let u connect a lot more stuff

as a musician i have both so i can just take the ste on its own where
ever i go so it is worth it to me

The best way is to use the TT internal psu ony for one internal device.
External devices need's a external psu.

With some drives, like quantum fireball, you can't boot up. Witch drive
do you like for your TT internal?

I'm not tested to boot from a EzFlyer or a ZIP. Sorry.

Regards, Robert

Hi

If anyone has any enquiries regarding the former public domain library
known as L.A.P.D, I'd be grateful if you'd direct them to me at the

following email address - lapd@steverosie.demon.co.uk

I have taken over, added to my own and hopefully be able to keep some PD/Shareware support going.

At present I will honour the previous prices, as sorting things out will take a while so please be patient as Rome wasn't built in a day; although you can roam in a day:)

I've had to swallow my pride and start to use my PC for internet access especially email. Newsie could no longer be viable due to the restrictions on the mailboxes.

The trouble with PC's are that you have to back up data regularly, something you could get away with on the ST's as they are more reliable and stable. Run a wrong program on a PC and you WILL have to reload ALL the operating system from scratch:(and it's took me a FULL 7 days.

I thought that the Y2k (year 2000) problem was the biggest money spinning con going until I met the PC! It makes you wonder what PC stands for! Could it be a 'pricey contract' or 'pretty c#@*' :)

Stay tuned, the Atari saga continues.

--

Cheers! for now

t> I notice that it was mentioned that both the internal and external
t> chains might have to be terminated. Should terminate? If so, what do
t> I use for a resistor pack? (two were supposed to be included, but I
t> bought it second hand).

Some bigger quantum devices needs initator identification.
You must have an host adaptor they support this..

TE: Jumper MUST be set if your device is last or a single device on your bus.

With a TE jumper mostley you doasn't need resistor packs.
The device mangage the termination by set this jumper.
Have a look behind the scsi connector, if you found a empty line
with oooooooo oooooooo oooooooo some "holes", that's the right
place for resistor packs.
The right size is 220/330Ohm (device resistor arrays)

EP: Some devices needs als PARITY, that's also a part for your host.
Your host support parity?

Rest of your jumpers can be OFF, allways.

J13: With that jumper set ON, your host adaptor MUST support/deliver
TermPwr (Pin 38 +5VDC) to the SCSI bus.
OFF: Device supports it self.

Regards, Robert

Anyone interested in buying a 1040-STe Outer shell from me? I sold the internals inside a case and now have the outside plastic sheel (along with the inner metal casing) left.

Make me an offer and it is yours - offer is subject to postage and packing on top.

Regards
Danny

Bernie Diotte uses a Y cable both for drive supply and SCSI chain.

Basically, he sliced off a couple of milimeters of each casing half,
where they meet above the SCSI connector:

```
       --------------------------------------
-------  =======SCSI=RIBBON=======  *POWER*  -------

The Upgrade Shop makes an IDE controller called IDEal, which uses
the STE's 68000 socket. It can be used alone or with the optional
accelerator called Veloce+ which they also make.

There were also plans for making an IDE adapter, published in
some german magazine a few years ago.

> standpoint).

I think you may have missed the point - ie, the poor old Atari can't compete in the number crunching game. It doesn't matter how much we love our Atari, they just won't be as fast as a 500Mhz Pentium processor with 256 meg of RAM and a 9 gig hard disk.

What we need is a new Atari design based around a newer CPU, which brings us back to a previous posting about building an entire Atari from scratch.

Ever since that posting I can't help thinking about attempting to build a newer, faster Atari with a slightly modified TOS. You could even have a Microsoft compatabilty mode where the machine could just crash for no apparent reason - or an Intel mode where it got answers to simple mathematical problems wrong.

Seriously though, it could be possible to achieve this. Linux started out as a simple usenet posting about writing an Intel version of Unix and now it has had contributions from all over the world. Maybe the Atari minds of the world could achieve something similar.

Maybe I shouldn't drink before reading news groups ;-)

Steve

How about reviving the old Inmos T800 transputer concept, with added Intel and Motorola cards, both in CISC and RISC (PowerPC, i960) areas :-)

I did not miss the point however. A TT can simply not be compared to a modern PC. Compare it to 386's and you have a fair comparison in terms of technical specs and date of creation / era.

Perhaps if you re-read my previous post in this thread, you'll see what I really meant. :-)

Keep the Fuji alive :-)
<<snip>>

As for new Atari system: the more competition and clones or compatible Atari systems, the better for us users. I know I would be interested :-)

No, definitely not. Only Quantum Empire and Fireball require initiator identification.

You can boot from any drive except a drive that requires initiator identification. Only Quantum Fireball and Empire are currently known to require this.

I have checked it when I last looked into the monitor and it seems OK.
Maybe I will look again. It came to my mind that maybe I did not
notice a small voltage drop.

>I saw a PC monitor that exhibited this same behaviour and was fixed by
>replacing one resistor. Apparently the resistor was getting too hot
>(design fault). A resistor with a higher power rating was used in it's
>place. Not that this story helps you in the slightest :-)
>

An electronics engineer told me some time ago that a standard design
in TVs and monitors is to integrate the luminosity signal with a
resistor+capacitor and use that to make a width correction in horizontal
stage. If that capacitor breaks down, the symptoms are supposed to be
like those exhibited by my monitor.

Unfortunately, it seems that SM124 does not have this correcting feature
(or maybe I can not recognize it in the schematics I have- which, in any
case, does not quite match my monitor).

Best regards...

Hi there Pat. I have a UMAX 1200S scanner and the ScanX software.
Is the Pro worth going to? I have problems running the Umax on
the Falcon and the ScanX. Perhaps the Pro version work better
than the standard version.

Thanks David

DOITF030 HTML V 6.2.8 Hardware Tip & Tricks Atari Falcon F030

DOITF030 is a simple HTML collection of Tips and Tricks around the hardware of the atari falcon f030 computer. Get all all cable and port pinouts, also pinouts and description of all the custom chips inside. Take a lot of descriptions of extra hardware, fitting and complete "how to repair" of the most of falcon subsystems. Create your own video, sound, ide and scsi connection. Most in german

_DOIT_ST_ HTML V 2.3 Hardware Tips & Trick ST Series

DOIT_ST contains Tips and Tricks around the ST series, custom pinouts and complete descriptions, how to repair, fitting and a lot of extra hardware. Most in german

DOITMAC HTML V 1.1.2 Tips & Tricks around the PowerMac

You take with DOIT_MAC port and cable pinouts. Found some tips and tricks around the desktop and powerbook machines. DOITMAC is ideal for newcomers. Ramexpanding, IDE replacement and some more tips included. Most in german.

DOITSOFT HTML V 1.5 Information about Atari Software CD-ROMs

A collection of information and description around software CDs.
A simple "what contain the disc"
Sure, that's not a lot, but think, i can't buy them all.
German only.

PROFIJAG HTML V 2.7 Tips & Tricks around the Atari Jaguar 64 Bit Hardware

PROFIJAG contains a lot ot tips and tricks around the hardware. Take all pinouts. Found the description to build ANY video connection. Have a look to PROFIJAG if your console or CD-ROM is broken. Found tips to fit the internal psu chip, slot replacement and some more nice "features" PROFIJAG contains a lot of colorised schematics. Most in german

DOITLYNX HTML V 1.5 How to Repair my Atari LYNX Handheld

DOITLYNX contain ALL pinouts of internal ports and custom chips! Some colorised pictures and schematics are the highlights. Contains descriptions, line tracing for subsystems like video and LCD, sound and internal psu part. Watch the LCD high voltage! German only

DOITSPEED HTML V 1.0 Atari, Mac ISDN an SpeedDragon

AT-Commands, short description of some urgend features. Start up and save time by suppress some mistakes. Connect ISDN line, connect normal modem, phone to the SpeedDragon ISDN unit. German only

DOITDRIVE HTML V 1.0 Easy connect your Hard drive

Simple things for easy handling of IDE and SCSI devices. Not specific for any platform. Contains jumper descriptions. Smal handling orders, the right bus termination and some tips from the sight of an device user. German only

I know but the problem is that the non-Atari-compatible partitioning format is an option, i. e. not only the driver version (I don't have information about all the different driver versions by ICD) is important but also the options used for partitioning.
Anyway, the HDDRIVER package (not the demo) contains a program by Thomas Binder called ICD2AHDI. This program converts the ICD partitioning format to an Atari-compatible format without destroying data.

> Problem with the demo is that it is VERY restricted.
> I have more than 4 HD partitions and so I didn't wonder
> that the HDDRIVER demo could find my ZIP drive on SCSI but couldn't
> address it with a DOS zip-disc in it(no read).

This has nothing to do with restrictions in the demo version. If you want to access DOS compatible partitions either Big-DOS, MagiC or FreeMiNT 1.15 are required. I think this is also mentioned in the README or on my web pages.

> Any other tools to simply read or write from/to DOS
> formatted/partitioned ZIP discs via SCSI?

There is no way to use DOS compatible partitions > 32 MByte without Big-DOS, MagiC or FreeMiNT 1.15. What you can do is to create a ZIP medium that is at the same time DOS and TOS compatible with the full version of HDDRUTIL. In this case no additional software is needed in order to exchange data between TOS and DOS. In case you doubt that this is actually possible with HDDRIVER simply ask other HDDRIVER users about their experiences. There are a lot of users that benefit from this feature, including myself.

That's not totally correct. HDDRIVER does recognize (at least it should, usually there is no need for it anymore) more than 4 partitions in this case. But what you should never do is to install a bootable Atari compatible driver on such a drive because the bootcode might destroy partitioning information. HDDRUTIL checks this before installing HDDRIVER but nevertheless you shouldn't try.

I was told, that MiNT will run but not be able to do very much
with 2M memory.
Sorry it was my fault - I should give some technical information
about my current hardware setup:

```
Mega 2 (2MB memory) -> ICD AdSCSI ST => Seagate ST1480N
                                     |=> iomega ZIP (SCSI)
```

> But the ICD-driver should be avoided, so if that's what you
> have now you really should consider HD-Driver or CBHD (free).

What are the main differences between HDDRIVER and CBHD
(except that CBHD is free)?

I missed that bit.

I know.
I thought a line like "very old versions before X.X..." could help.

> But it's very simple: If HDDRIVER won't find more than 4 partitions on
> one of your drives (not in total) even though you have, then your drive
> was partitioned with such an old version.

I guessed that. ;)
It found exactly the 4 first partitions (of 5 on my Seagate ST1480N).
Which means that the ICD software that is "currently" (1998)
sold with their host adapters is "very old" ;)
(see versions in my last posting)

[...]
ME> I have more than 4 HD partitions and so I didn't wonder
ME> that the HDDRIVER demo could find my ZIP drive on SCSI but couldn't
ME> address it with a DOS zip-disc in it(no read).

I forgot to mention, that I also tried with an ATARI formatted/partitioned
ZIP disc in the ZIP drive and couldn't do anything with it because of the
"4 partition limit" of the demo version.
So the HDDRIVER demo not showing the ZIP drive comes from it's
"4 partition limit" because the ZIP drive comes after the 5 partitions.

> See above. You need additional software to access DOS Zip disks via
> GEMDOS.

Thanks for that info.

MiNT itself will work very well, but with only 2Mb you can't run a multitasking AES, replacement desktop etc. without running out of memory very soon :-)

If all you need is some way of copying files from DOS-Zips to your local harddrive then plain MiNT and a desktop that handles long filenames (e.g. Thing) will be enough.

> What are the main differences between HDDRIVER and CBHD
> (except that CBHD is free)?

I can't really say, I haven't followed CBHD-development for a couple of years now.

And me. My experience with the "TOS+DOS" format is that it works absolutely perfectly, I haven't had one single problem with it.

I bought my ICD adapter this year and obviously even this adapter
makes HDDRIVER read only the first 4 partitions, which means that
even the 1998-ICD adapter seems to be an "old version"... ;)

> Anyway, the HDDRIVER package (not the demo) contains a program by Thomas

Can I rely on that "without destroying data"?
Well, I made a backup anyway...

> > Problem with the demo is that it is VERY restricted.

> or on my web pages.

You mean the
"With the MagiC operating system there are up to 23 partitions,
with Big-DOS up to 29 partitions. "
at
http://acp5.chemie.uni-kl.de/seimet/hddriver_english.html ?

It wasn't clear for me from that sentence, that HDDRIVER needs BIGDOS
to read DOS ZIP discs.

The sentences on your WWW page
"Works with all kinds of hard disks and removable media
(MOD, PD, SyQuest, ZIP, JAZ, LS-120, ...)."
and
"Support for DOS/Windows formatted media as well as DOS/Windows
compatible partitioning directly with the Atari."
sounded very general and as if there is no need for other software.

The README of the demo may be different of course...

But the "4 partition" limitation makes it impossible
to access the ZIP drive if it is e.g. "partition H"
(thus having 5 partitions before that).
That's what I meant with "VERY restricted".
And I didn't want to repartition...

> > Any other tools to simply read or write from/to DOS
> > formatted/partitioned ZIP discs via SCSI?
>
> There is no way to use DOS compatible partitions > 32 MByte without
> Big-DOS, MagiC or FreeMiNT 1.15.

That information was missing.
So either I partition the ZIP disc into 3 * 32 Mbyte or I need
BIGDOS (MagiC?) to use the ~100MB as one partition?

> What you can do is to create a ZIP
> medium that is at the same time DOS and TOS compatible with the full

> their experiences.

Ok, so all other readers: What are your experiences with HDDRIVER 7.6
full version?
Do you think I can use it
with

```
Mega 2(2MB) -> ICD AdSCSI ST => Seagate ST1480N (5 partitions)
                             |=> iomega ZIP (SCSI)
```

??

Thanks in advance

No, if you're going to repartition the Zips (i.e. don't need to read
"real" DOS-partitioned Zips) then just use HD-Driver's "TOS+DOS"
option. It works perfectly, the disk is usable with TOS, MiNT, MagiC,
BigDOS, NT, Win95/98, DOS, Win3.11 and everything else that reads
DOS-disks.

The limitation is that you can only have one partition on each
media, and the partition can not be bigger than 1Gb.

```

Yes, there should be no problems with this setup.

In my neverending series of questions, and the adventurous nature with which I approach the Atari, I recently acquired a rather large cache of FLASHable EPROMs (EEPROMs?). Originally, I was digging through a crateload of discarded motherboards, looking for usable EPROMs, knowing that the BIOS on most motherboards uses this device. As it seems, there were a lot of newer motherboards in the mix, and they all had EEPROMs (I am making an assumption - these are the ones that are flashable).

How difficult would it be to:

1) Install these EEPROMs in place of the EPROMs used in a standard ST... (1040ST, STf, etc.)
2) Load TOS from diskette, so that it resides in memory...
3) FLASH the EPROM with the TOS of choice?

I am afraid that I may be deluding myself, but I assume that the ROMs can be written to in some manner. Either way around it, wouldn't this be a neat hack?

I have had a similar problem with one of my old drives. If it is left off for a couple of weeks, it tries to spin up, but fails. The way I get around it the the old "if it's bust, hit it" scenario. With it switched off (to ensure the heads are parked, drop the drive from a couple of inches (assuming you have an external).

I think it's just the motor seizing up. The drive works fine if it is kept in use though!!

Gav.

Writing into FLASH involves usually higher voltages (12V) and special protocols
and for that function special hardware is needed, so just exchanging EPROMs with
FLASH
would not mean that you can "FLASH" chips from diskete...
Besides, what would you do if there is power glitch or some kind of error that
causes the system hang during the
FLASHing, as you call it ?
Since the content of FLASH would be then unpredictable (and very very probably
unusable), your computer
would not recover after reset as there would be no valid TOS. Keep in mind that
even if you have some kind of TOS on diskete, you still need boot code in ROM,

which would load TOS after reset/powerup, so that would not work either.
IMHO, FLASH writing as used in PeeCees hookerboards is not worth a dime, because
there is no reasonable way of
recovering from failed FLASH writing....

No circuit for /flash and /delete pin avaiable..

>2) Load TOS from diskette, so that it resides in memory...
>3) FLASH the EPROM with the TOS of choice?

That will not work, atari hardware miss the circuit to "flash" and
for that type of eprom. The only way to get another TOS is to
take the same type of eprom and burn the new TOS with an eprom burner.

Most atari boards contain ROMs, they are burnend for one session, for ever.
TOS is not removable. Only the hole chip..

Point 2 and 3, in my opinion, only works with a brand new milan and
an falcon ct2 accelerator board. All other atari machines can't chance
TOS by use a "flash" mode (Otherways anybody design a new hardware) :)

The idee is realy good, but not usable without extra hardware.

Point 2 works well, some older TOS release are only boot from disk
In early times, i chanced the TOS-Loader (Disk Bootsector) and load
the hole stuff from hard drive C:
But you loose a lot of ram if you use that..
Hard job if you only have 1Meg RAM

Some utilities create a TOS.IMG file(s) out of any TOS in ROM.
Easy to use for an burner, hard to create a ready to boot TOS disk image.

I can't remember me to all..
Hope to understand all well and that here was a smal help.

(Nearly 40, need's help to cross the street) :->>

Regards, Robert

Recently, I accomplished another successful hack on the Atari, one which I
am quite proud of.

In all fairness, the original document that came as the source for this hack
was found on the Atari ST Quick FAQ page. It described how to take a
Microsoft Bus Mouse and modify it for use with the ST.

I had a Bus mouse, but not a Microsoft one. In fact, I can't determine what the brand of this mouse is. The back of it reads:

```
                    BUS MOUSE
                    Model No. :  TX-2B
                    S/N:  KAM 137351  (I assume this a serial number)
```

At any rate, from the document, I came to learn that modifying the Bus mouse to work on the Atari is a matter of just switching some pins around.   So, I pushed a DB-9 pin connector from Radio Shack, with solder cups, and got a nine-strand cable I had laying around the house.

Solder the wires up, according to the corresponding pins, and blammo! The thing works. Better than my Atari mouse when it was BRAND NEW. Smooth as a baby's bottom.

Anyone interested in hearing more about this hack?

I have to agree. I've just got to find some more fun things to do with all of these EEPROMs I've got.

Why am I so obsessed with TOS:es? Because I'm in the process of hacking out a TOS upgrade, and I'm just analyzing different options.

Quite a lot. I suggest you simply download both, i. e. CBHD and the demo
version of HDDRIVER
(http://acp5.chemie.uni-kl.de/seimet/atari_german.html) to get an
impression yourself. The HDDRIVER demo archive gives you additional
information on the features of HDDRIVER and the tools coming with it.

Or you used a wrong option for partitioning.

> ZIP disc in the ZIP drive and couldn't do anything with it because of the
> "4 partition limit" of the demo version.

There is no 4 partition limit of the demo version. There is no limit except the limits mentioned in the README file coming with the demo archive.

Big-DOS or MagiC or FreeMiNT 1.15. DOS-compatible partitions require support from the operating system, i. e. a hard disk driver (regardless which one you use) can't support them completely on its own. This is why additional software is required.

>
> The sentences on your WWW page

> sounded very general and as if there is no need for other software.

Please read all of it, i. e. the notes below where Big-DOS MagiC etc. are mentioned and note that if you partition your medium with HDDRUTIL you can do with with a special option that doesn't require additional software.

> And I didn't want to repartition...

You don't have to if you run ICD2AHDI. If you don't repartition or use ICD2AHDI I doubt that you will ever be able to exchange data with your PC with partitions > 32 MByte.

> > There is no way to use DOS compatible partitions > 32 MByte without
> > Big-DOS, MagiC or FreeMiNT 1.15.
>
> That information was missing.

I don't think so because my Web pages say so. Anyway, it's the way it is.

> So either I partition the ZIP disc into 3 * 32 Mbyte or I need
> BIGDOS (MagiC?) to use the ~100MB as one partition?

Yes, this is correct. That is, it's correct if the ICD software supports DOS compatible partitions < 32 MByte. TOS can cope with DOS compatible partitions < 32 MByte (i. e. no Big-DOS etc. needed) on its own but in any case these partitions have to be supported by your hard disk driver. So, if this is still unclear, both parties have to support DOS compatible partitions: The hard disk driver and TOS. For partitions < 32 MByte TOS has kind of built-in support and you only need an apppropriate hard disk driver. For partitions > 32 MByte TOS _and_ your hard disk driver have to support this. Except for the DOS/TOS compatible partition created with HDDRUTIL where no special TOS support but only an appropriate hard disk driver is required.

BTW, one thing that might be useful concerning HDDRIVER and your hardware is that HDDRUTIL and ZIPCTRL.CPX (both part of the HDDRIVER distribution) are the only software for the Atari with which you can configure all of the settings your ZIP drives offers like auto sleep, auto park, password-based read/write protection. (You asked for differences between HDDRIVER and other packages. This and the TOS/DOS compatible partitioning are only two of them. There is a lot more. And there is support.)

> The limitation is that you can only have one partition on each
> media, and the partition can not be bigger than 1Gb.

To be more precise: The partition cannot be bigger than the largest TOS partition supported by your version of TOS. So for TOS 1.0x it's 256 MByte, for TOS 2.0x/3.0x it's 512 MByte, for 4.x it's 1 GByte. In case MagiC, Big-DOS or FreeMiNT are running it's 2 GByte.
When a partition is TOS/DOS compatible the Atari only sees the TOS compatible layout. This is why you have exactly the same limits with these partitions that you have with partitions that are purely TOS compatible. And these limits completely depend on your version of TOS.

Hello,

I wrote about my idea to comp.sys.atari.st group, but no one answered me in the way I'm satissfied. The idea is to use a (cheap, old) (S)VGA ISA card as a VME graphics card for TT. Of course, one has to build a 'converter' ISA-VME. I can see only two problems:
1) the REFRESH signal on the ISA bus. Does anyone know anything about its occurences in the bus cycle (and what is done then?)
2) memory addressing. How to inform the TT system that the screen memory

address is located at the VME area? Is it possible do do it directly (or
maybe the VME addresses exceed available memo range of the screen
memory?). The second way is to make patches for all the VDI calls.

Can anybody help me?

Chris

Hi everyone,
I am a PC guy, but just got hold of an Atari 1040ST w/colour monitor &
printer.
I would like to learn about this system, but I think I'm missing some vital
software.
When I turn on the system, I see a desktop with floopy drive icons, but
don't seem to be able to get any action out of anything.
The system will read my PC floppy's from the built in 3.5".
I did not receive any disks with the machine, Do I need this TOS I am
reading about?
Is there an FAQ for this system anywhere?
Any help would be much appreciated.
e-mail reply would be super, since I travel alot without a newsreader.
Thanks in advance.
Tim

The system software, called TOS, is in ROM. So that's all you have. The
desktop is used to read drives, copy files, and launch applications. So
basically, you have the system, but you have no application software.

> The system will read my PC floppy's from the built in 3.5".

Yup.

> I did not receive any disks with the machine, Do I need this TOS I am
> reading about?

TOS is in ROM. That's what you already have.

> Is there an FAQ for this system anywhere?

The Atari ST Quick FAQ
http://www.multimania.com/bales/quickfaq.htm

What you are actually after is application software. A good place to
start, other than the FAQ, is the UTSI:
http://www.ping.be/~pin10575/PRG-IND3.HTM

I had the same with an Quantum 552 Prodrive. After standing idle for
a few days it took time to start spinning up.
Week after week that time became longer.
Now it takes about 4 minutes and afterwards the drive does not answer
anymore.
A specialist told met: the ball-bearings are gone!

Hi everyone...

i've just upgraded the memory on my TT and have started having some problems....

ok... here's the deal...

i've been using the MegTT memory card on my TT for ages, and has always had 8x 1Mb 70ns 3 chip simms installed on it.

after realising that i actually had 4 4mb 70pin 9 chip simms doing nothing other than collecting dust... i decided to upgrade the memory in my TT to 24mb, by removing 4 1mb simms and replacing them with the 4 4mb simms to give me 20mb on the MegTT board along with the existing 4mb on the original ST ram board.

after i had done this... some of the programs which where set to run in tt-ram (fastram) and had worked fine in fastram before the upgrade cause the machine to bomb-out, giving (if i remember correctly) 11 bombs, or line a(?) emulator error

as far as i can tell the 4 simms i added are 100% ok, before this they where used in a VESA PC cache controller card which was fine...

anyone have any ideas?

of course i have made all the dip switch changes nessesary on the megtt board.

or should i just put the 4 1mb simms back in and go back to 12mb?

rgds

Hi Chris...

if i remember correctly the one of the old NOVA grafx cards used this technique, they where just regular PC ISA cards with a simple logic adapter board to convert the signals... in fact i'm sure... i remember seeing one in the flesh at an old atari show here in the uk.

on my TT, which uses a Crazy Dots II card... there's a 'redirect' program which redirects all the text output during bootup to the crazy dots card.... i have a feeling this just makes the TT think that it's video memory is on the crazy dots card... or in other words, it changes the memory address to point to the VME addresses.

if you like i can email you the redirect program for u to hack, it maybe somthing to get you started...

unfortunatly i can't help you with your hardware issues... apart from to say it can, and has been done before...

Hmmm, you should be able to at least select the drop-down menu items (file info, format floppy, change resolution, etc). I take it you have the mouse plugged in? (A PC mouse won't work.)

That is quite easy, but probably won't do you any good. I doubt very much that the Atari screen image in RAM matches that of the VGA card, either in terms of color coding or height & width.

g > The second way is to make patches for all the VDI calls.

That would be my approach.

This should work fine, but perhaps you should contact Michael Scwhingen (IIRC) who has already built a VME->ISA adapter for TT. It's so small that you can fit the adapter and a ISA-card inside the ordinary VME-slot :-) It's designed for ethernet-cards though, so I don't know how well it will work with graphics-cards.

> 2) memory addressing. How to inform the TT system that the screen memory
> address is located at the VME area? Is it possible do do it directly (or

Not problem, but there are a couple of restrictions:

1) It will only work in mono, as the TT doesn't have a VDI that works with anything over 4-plane graphics (which is not supported on VGA-cards)
2) It will not use the hardware-accelerator most VGA-cards have, so it will not be faster than the normal TT-graphics.

To do this just init the VGA-card to a working mono-mode, inform the VDI about the new resolution (which really is a hack but it works) and set physbase and logbase to point to the start of the VGA-card's videomem.

> memory?). The second way is to make patches for all the VDI calls.

Or to use an already existing VDI, like NVDI5 (works with ET4000-based VGA-cards) or Nova-VDI. If you want something free then write drivers for fVDI. The advantage of these solutions is that you can use the hardware-acceleration in the VGA-card. My Nova-card is 20 times faster than the Videl in my Falcon because of this :-)

I was looking at Nick Bales' excellent Atari FAQ page and I decided I would like to build an Atari ST to VGA adaptor. The trouble is is that I can't find a cord that would go from my ST to the adaptor. Also, in order to build the adaptor, I would need some female connectors to plug the cord into. Does anyone know where I can find these? Is there a dealer (preferably in the US) that might have what I'm looking for?

Tried Best Electronics in San Jose ?

Here in Europe, you can find these in most electronic parts shops.
Maplins in the UK carry them, as well as the Conrad Electronics
catalogue in most other European countries. They have a web based
catalog in which you might find it: http://www.conrad.de/

I have a NEC Multisync monitor connected to the TT. During use there
will occasionally be a surge of Blue intensity lasting only a second
or so after which normal colour is resumed. The red/green seem to
remain constant during these surges.

Has anyone experienced/diagnosed/cured such a problem?

I am hoping, of course, that this is not a sign that the tube is
dying.

I suspect an intermittent fault associated with the Blue amplifiers/drivers - maybe a dry joint or a cracked resistor. Am I on the right track? Are there other circuits I should be looking at?

Thanks for any help.

I don't think you'll find that sort of thing ready-made. You'll probably
have to make it up. You can find the Atari pinouts in the ST Quick FAQ,
but I don't know where the Amstrad pinouts are.

Have a look to DOIT-Archives. 13 pin female atari plugs are rare..
But you can build you cable one side atari, other side vga (9 or 15 pin)
DOITST / DOITF030 contains colorised schematics.

Regards, Robert

There are 2 ground signals on standard Atari cables, so maybe one of them
could be turned into a HD signal.

You can also add a second cable, with a HD signal. Not to nice on the desk
anyway so it might be a good idea to put the mainboard and the drives into
a tower so that you can easily plug any wire you need to any peripheral.

Objet: Re: The High Density Hack

Interestingly, you can format a HD disk in an atari as a 720 K disk but you
will find that it is unreliable. I have found this out the hard way and
lost
LOTS of data to HD disks formatted for 720k.

You may be able to drill the proverbial hole in the DD disk and format it
as
1.44 meg but don't count on that either. Data is not stored in the hole ;-)

I remember an "engineer" telling me that the manuafacturers used the same
"cookie" inside. This turned out to be a load of cobblers. Since then,
somebody
who new more facts explained why the two aren't interchangeable but I can't
remember the details now, I just know not to do it.

I was sitting here thinking the other day, and it came to my mind that the 68000 processor, which is notably reliable, and runs particularly cool, could easily be overclocked to higher speeds with just a little nudging, and the aid of a processor fan for safety.

Now, the chip takes it clock signal from one pin on the board. On my 1040STf, this is an 8Mhz signal.

Bear with me.

If I were to clip the clock pin from the motherboard, and feed it a 16mhz signal, would it, theoretically, then run at 16mhz?

I've seen a few accelerators along these lines, and I'm dieing to try it, but I wanted to hear from other Atari techies out there, to see why it won't work this simply.

A simple patch could be designed to switch the step rate, based
on the HD-detect pin fron the floppy drive being fed into either
that spare ACIA signal or.... what about the GPI pin from video?

does anybody have a good general guide to upgrading st ram?

i have tried the
docs avaiolable in the umich archive and others but they all
 refer to
different revisions of the st but not the same as the two that i intend to
upgrade:
520stfm tos 1.02 - c103414-001 - rev1.1
 8 ? surface mount drams
and
520stfm tos 1.0 - c070789- 001   rev.c
16 ? 16 pin dil(?) drams
is there a
standard rule book for upgrading st or are they too different?
 also i have
some 512k simms that used to live in my ste (now 4mb)
could i put the chips
from these (they are the same physical size as the dil
packages in the st)
into the st with tos 1.0 , they even have decoupling
capacitors on them, if
this is possible what else would i have to do to make it
work apart from
soldering the chips and capacitors in?

also is there still any comercial
boards available to use simms in an st?

i hope someone can help otherwise
the computers are prety much useless to me

perhaps this (essensial)
information should be included (if not already) in a
special resourse for
atari users. i would be prepared to help with this if i can find
time.
citizen_smith@hotmail.com

email reply greatly apreciated - i'm too busy to
read usenet daily

>No, even Atari with the TT has not found a hardware cludge.

But many others have - it is quite easy:

First, you need the HD-detect-signal from the floppy drive to auto-switch to 16MHz when a HD disk is inserted.

Then, use the STEP signal from the FDC to trigger a monoflop (oneshot) set to a bit below 3ms time, and while its output is active, switch the FDC to 8MHz clock - voila. There are several HD modules available which use this technique for quite some time now.

The whole thing can be easily done using one GAL16v8 and one 74LS221 or similar. You can use the same system to auto-switch to real 6ms step for 40 track 5.25" drives.

That is possible. I did it for an external HD drive on a Mega ST4.
Look at the floppy plug on the motherboard from the backside. On the
right side of the f-plug you find a flat wire going up/down. Check
you have the good one.
Destroy the connection.
Do the same with the round f-plug on the external floppy drive.
You confiscate one ground-wire (and still have one left!!!).

How about up to four different TOS's? May seem pointless, but there's
always 1.40, for updated old-software usage, 1.0 for maximum old-software
compatibility, 2.06 for everyday use, and KaosTOS when you feel funky.

>However, you can also leave the old chips be and just add the new ones.

:This is because PC BIOS doesn't use that HD signal : it
:assumes that a HD disk is in the floppy. So, it first turns HD mode on,
and
:if it can't read the disk, then it turns HD mode off (<-> DD mode on)
and
:if it still can't read the disk, then it's a faulty disk.

Seems much smarter than the Atari way. Has nobody yet tried to
write something like this for the Atari floppy routines?

There are a few free registers out there. On p5 of the two ACIA:s
one could pick up a switch signal that the routine would generate.
This would steer the feed of the FDC with alternatively 8 or 16
MHz. Since Lacescan uses the keyboard ACIA, I'd suggest the MIDI
one for this purpose.

The gain would be that any HD diskdrive could be used on the Atari.

Maybe it will be a new feature in coming versions of MagiC?

Try Paint Shop Pro 5. Among a lot of others, it also has support for GEM
images. You can download it from http://www.tucows.com (shareware, of
course).

And, you really should teach yourself German, it helps a lot in the
Atari world. After all, it's not that different from English...just a
few hundred words and a different grammar :-). Now if it would be
Finnish...|:-O

It was a little card that brought out the three channels of available
sound in the ST range of computers from the Yamaha sound chip.
It really wasn't stereo. I think it was made by Practical Solutions
makers of the "Video Key" monitor adapter for ST's (included composite
video for machines without an RF modulator).

Forget soldering chips to the motherboard. It is really a hell of a job
to do that by hand, and even then you'll be stuck at 1Mb, which is still
not enough by today's standards.

> also is there still any comercial
> boards available to use simms in an st?
>

Yeah. Availability depends on the country you live in though. There are
plans for such a board on Vezz's Hardware page somewhere too.

Ever tried the Quick FAQ ??? It's in there.

I agree. A man in Poland did that several years ago. But as I know,
apart from that the system was only _FEW_ percents faster, there're
problems with ACIAs. I don't know the details, but in general the
speed-up was not worth to be done.

Well, I've beed thinking of speeding up my TT for months. I have the
same problem: I can boost the CPU, but the 32MHz clock feeds the video
chip as well, so what will happen if I change it to 40MHz? Remember that
it could be 'almost' the one problem as 030 CPU has cache inside that's
a 'bridge' between slow RAM and fast CPU, so speeding up a CPU shouldn't
lead to crash of the system. The FPU, FDC, ACIAs, etc can be clocked
independently.
So if you have any ideas of speeding the TT up, please let me know at:
grabek@hermes.umcs.lublin.pl

Is anybody interested in buying an SM124 monitor?

I live in Cardiff, Wales, UK.

Yes, some work on high clock speeds, some not. Just like the floppy
controller: you can be luckey or not.

>

If you can keep the phase of the signals good: yes.

Ok say it works....
What extra velocity do you get?
For normal applicaties about 8 percent, not more when measured with
QuickIndex.

And that for mosty the extra cost of a 16 MHz 68000 CPU????

:-)) It IS possible, honestly, I've done it.

I replaced the original 256Kb chips with 'doctored' chip carriers which would take 1Mbit chips. This gave me 2Mb in the one bank available on my old STM. I got the other 2Mb via Marpet.

I think this mod. was described by Barry Orlando.

You are right, though, it is one hell of a job. IIRC I had about 5 dry joints in the 500-odd which I had to make. It was quite a job finding them!

:If I were to clip the clock pin from the motherboard, and feed it a
16mhz
:signal, would it, theoretically, then run at 16mhz?

It would be completely pointless.

Even if the timing towards other circuits was ignored,
your 68000 would rush away for a very short while and
then wait, wait, wait to get contact with the rest of
the system. In worst cases it would even be slower than
a standard system.

An interesting idea would be to overclock the whole
system instead, to say 10Mhz. Some circuits would have
to be excluded from the overclocking, since their
function would be disturbed or halted with a change of
the clock. These are: The sound chip (Yamaha something),
the two ACIA:s, the FDC, and a special arrangement for
the Shifter. The shifter would need to follow the rest
of the overclocked circuits, but then the picture it
produced would be completely distorted, maybe it would
even blow up your monitor.

A graphic card could solve this.

I haven't tried this myself but it could well work.

I tried a MC68010 once, it was nothing special, maybe
5% faster? But then again, it could have been the
placebo effect?

:could be turned into a HD signal.

In fact, that's the Atari "standard", the Mega STE and the TT have set
the path.

Otherwise one could just ignore the 720Kb format altogether!
If you need to swap disks with someone he can find a PC in
which he could read your HD disk...

:Anyone have experience with upgrading TOS to 2.06 on a 1040STf?

Yes, I've done several. It's pretty much about planning and being
organized.

:I have seen some project files on The Atari Hardware Hack

:page (greets to the Vezz),

I've improved that hack a bit, you don't need the F type of circuits, LS will do fine. Also the whole 74F244 can be replaced with one single diode, a 1N4148, cheaper and takes less space.

:just wondering if anyone here had actually
:attempted the TOS switcher project (where you can switch from one TOS
to
:another).

Hm, THE switcher? Done a lot of these too, but my own designs. You can solve this in maybe 10 different ways. The easiest is to buy EPROM:s with enough capacity to program two TOS:es into them, then you switch the highest address by hand, making either half of the content being the actual one.

However, you can also leave the old chips be and just add the new ones. In that case you might want to selectively inhibit one of the TOS:es at a time. Realized through 2.2Kohm resistors and laying +5V to the inhibited circuit's CE pin.

I'm very new to this NG, I need some informations for
a friend who own a 1040ST...

1. Where can I find a 1040ST FAQ?
2. Where can I find some good website about 1040ST Hardware?
3. How to connect a 1040ST (via the audio/video 13-pins connector) to a
monitor via a SCART?

Thanks a lot to the Atari community

Have a look to www.rhein-main.de/people/robert/link.htm

you found a link for schematics down there
Otherway i have some extrem large files here..

Regards, Robert

Hello everyone,

I connected a Trust W95 kbd to my Desktopper Falcon.

The connection is made with a print called Adaptakey,
http://wwwusers.imaginet.fr/~oxo/systems

I use the Adaptakey driver in the AUTO folder like they say, but
for the kbd to work I also have to use Pascal Fellerich�s CKBD Deluxe
with the French kbd table. That way it works in TOS, Magic and N_AES.

My problem:
The Adaptakey driver dates from 1994 and so does CKBD.
It is a AZERTY kbd so I use F.KBD.
The top row keys (with the numbers) have two symbols in the lowercase
position and the keys next to "P" and "M" do not print the right keys.

- How do I get ASCII 045 "-" and ASCII 095 "_" to work properly?
  They are next to the BACKSPACE but all I get is "=+" in TOS.

- What about the following characters?
```
  [] are lowercase right next to the "P"
  {}                     under the "9" and "0"
  # and \ are unreachable (lowercase right "3" and ">")
```

Does anyone have a correct CKBD *.KBD file so I can get to the keys?
Especially BACKSLASH is important for pathnames etc.

Greetings,
Jan

I now decided to buy the iomega ZIP drive, SCSI version (thanks for all tips, I didn't want to buy Syquest because I've heard that they have troubles).

Now I want to read/write DOS formatted and partitioned ZIP discs on my ATARI (actually I write to the disc also with mtools on a SUN).

I read through the news in DejaNews and nearly everybody suggests HDDRIVER. So I got the demo version of HDDRIVER 7.6 yesterday.

But in the "readme" it says:

"[...]

NOTE:
Drives that were partitioned with very old versions of the ICD hard disk software are not AHDI compatible if they have more then 4 partitions. In this case the installation of an AHDI compatible driver requires repartitioning your drive with an AHDI compatible software package or converting the existing partitioning scheme to an AHDI compatible scheme with ICD2AHDI."

Now, that's not very helpful: which versions of ICD software do they mean?
"Old versions" is a bit vague...

Is the following software from ICD
HDUTIL   Version 5.13
and
ICDBOOT   Version 6.5.5
ok?

Problem with the demo is that it is VERY restricted.
I have more than 4 HD partitions and so I didn't wonder that the HDDRIVER demo could find my ZIP drive on SCSI but couldn't address it with a DOS zip-disc in it(no read).

Otoh I don't want to repartition and buy HDDRIVER now because
I couldn't test it.

Any other tools to simply read or write from/to DOS formatted/partitioned ZIP discs via SCSI?

Thanks in advance
ME

MiNT 1.15 will allow you to do that, it will also read VFAT and FAT32-disks. I use DOS/VFAT Zips on my Falcon daily without any problems. I have HD-Driver 7.12, but HD-Driver isn't required unless you want to read FAT32-disks (pointless on Zips, they're only 96Mb anyway). But the ICD-driver should be avoided, so if that's what you have now you really should consider HD-Driver or CBHD (free).

Hi!

In comp.sys.atari.st Markus Egg <Markus.Egg@vcpc.univie.ac.at> wrote:
> Now I want to read/write DOS formatted and partitioned ZIP discs on my ATARI (actually I write to the disc also with mtools on a SUN).

> I read through the news in DejaNews and nearly everybody suggests HDDRIVER.

I hope you've also read in these message that HDDRIVER alone is not enough to use PC partitions with more than 32 MB (which Zip cartridges have, of course) - you'll either also need MagiC >= 5, BigDOS, or FreeMiNT 1.15.0 to actually access the files on them.

> Now, that's not very helpful: which versions of ICD software do they mean?
> "Old versions" is a bit vague...

Well, I guess Uwe didn't check every available version of the ICD software to see when they changed from their partitioning scheme to AHDI's.

But it's very simple: If HDDRIVER won't find more than 4 partitions on one of your drives (not in total) even though you have, then your drive was partitioned with such an old version. But HDDRIVER ships with a small utility (which is also mentioned in the demo readme) that allows changing the partitioning scheme without losing data - nevertheless, the safest method to change it is doing a file-oriented full backup, re-partition the drive, and then restore the backup.

Note that you can get the above mentioned utility (ICD2AHDI) without HDDRIVER, too - just contact me. But be warned: It only has german docs (maybe the version shipping with the English HDDRIVER has been translated), it's not guaranteed to work (i.e. you use it on your own risk), and it's _not_ freeware or something similar (though it doesn't cost money).

> I have more than 4 HD partitions and so I didn't wonder that the HDDRIVER demo could find my ZIP drive on SCSI but couldn't address it with a DOS zip-disc in it(no read).

See above. You need additional software to access DOS Zip disks via GEMDOS.

Ciao

Thomas

P.S.: Just a note: the message starting this thread is a nice example for a good crossposting: It has a Followup-To:-line.

Format the discs on the PC which the ST can read.

Alternatively, TOS 2 or Magic format with MS-DOS compatible boot sectors anyway (if you are using them of course!)

Gav.

It's a bit more expensive, but the Plus version adds parallel interface in addition to the SCSI which *may* provide more flexibility. In my case, this allows me to take the drive to work when necessary.

I faced this problem myself recently. I downloaded the demo on several different occasions and decided that the move to HDDRIVER was a one way trip from ICD... I never installed it.

There is reference in the demo to a program which will allow you to make your old ICD partitions compatible but I did not know where to locate the program.

My solution: purchase the real HDDRIVER, backup my harddrive, and never look back. Yes, it's a bit of a pain but IMO very much worthwhile. Little unexplained problems are now gone. For example, my CAB Cache used to become corrupted on occasion under ICD. That problem has not reoccurred. I used to have CD Rom problems, don't ask me why because it doesn't make sense to me, but those too are gone.

I purchased the ZIP Plus, plugged it it, crossed my fingers, and... it worked out of the box and has worked flawlessly every since. Anna can now easily move here data between home and school. The graphic files were just too big to move on floppies.

I purchased a UMAX scanner and ScanX PRO and that too works flawlessly.

ICD is no longer supported. HDDRIVER is, it works and works well.

Just my $.02.

Pat

I have been having a problem with the hard drive on my ST. Sometimes it spins up, sometimes not. When it does not spin up, it starts and then seems to give up. It started acting up this summer when the room was quite warm so I thought that was the problem. In fact, over the summer it did seem to work better when the temperature dropped but lately even 23 C seems to be a problem. It is a fairly old Micropolis 85MB drive. My question is as follows:

In your experiences with hard drives, is this intermittent problem with the hard drive spinning up due to the power supply or the hard drive itself?

I have tried an old floppy drive power supply but the drive did not even attempt to spin up with that. Only the front light came on and I heard the click of a relay. Of course, I don't know for sure whether that old power supply is any good.

I would prefer responses by E-mail as I may miss them in this newsgroup.
Remove the .NNOSPAM in my E-mail address to get my real E-mail address.
Thanks in advance.

It could be the hard drive itself, that is, the onboard electronics may be failing. Since you're using an old drive, a Micropolis 85 meg, that could be the problem, that the drive is getting ready to die, or, the solder pads on the power connector are loose. I had this last problem on one drive in particular, and a soldering iron solved it.

However, if you can find someone that has a crashed drive, the same model as yours, you could quite easily swap out the onboard electronics. From there, open up the crashed drive, and rebuild it to become a clock...

A second thing could be the power supply itself. I have several supplies lying around, for testing purposes, since they're so cheap. Test it with another supply, and see what you get.

Heck, those power supplies are so useful, that they're even powering things that normally aren't used on there. My electric shaver's rechargable batteries finally gave out after 10+ years. However, the motor and shaver head are still good, so you can guess the rest. Hmm... I suspect this will be good for an ObHack in the alt.hackers newsgroup.

A floppy drive in itself doesn't do too well. It doesn't give you the visual or tactile feedback like a hard drive does. Do you have a testing device, that will measure the power outputs?

David Jackson skrev i meddelandet <72dtao$s92@sjx-ixn4.ix.netcom.com>...

:Well, my question comes now; as we all know, with the distribution of
:various versions of TOS, will the versions that work with Pacifist also
work
:on an EPROM?

Yes. But it's two EPROM:s. Pacifist uses a straight TOS image, 256Kb in size for TOS 1.62 or 2.06. The EPROM:s are like a shuffled deck of cards, first byte in chip LO, second in chip HI, third in chip LO, etc. You'd have to make two files out of one TOS image file, with all the odd (LO) bytes in one file, and all the even (HI) in the other.

This has to do with the processor's reading of 16 bits at a time.

On older systems you also have to portion out the odd and even files to 6 EPROM:s.

:Can you share that circuit with me/us/the Atari community?

Sure thing. It's at the end of this posting.

:How about up to four different TOS's? May seem pointless, but there's
:always 1.40, for updated old-software usage, 1.0 for maximum
old-software
:compatibility, 2.06 for everyday use, and KaosTOS when you feel funky.

No problem. Done three at most, but this one should be easy to do.
Why KAOS? Why not MagiC?

I should point out that there are disk based TOS:es as well, that might be an easier way to gain a multitude in versions?

:>However, you can also leave the old chips be and just add the new
ones.
:>In that case you might want to selectively inhibit one of the TOS:es
:>at a time. Realized through 2.2Kohm resistors and laying +5V to the
:>inhibited circuit's CE pin.
:>
:
:
:Where would you mount the new chips?
:

I normally solder two 32p sockets piggyback on two of the old ROM:s. One HI, one LO. I choose the innermost of these because of the increased height. The signal CE must NOT be connected to the sockets! Also pin 1 on the ROM:s must not be connected to the pin above.

The 32p sockets should protrude with four pins on the frontside. Additional couplings must be done depending on what type of EPROM:s you're using.

If the original TOS only uses two ROM:s, then we have four empty sockets to play with.

Regards, MG

++
++++++++++

The revised schematic after replacing the 74F244 with a simple 1N4148 diode:
(And you can well use LS chips!)

```
(19,XX)  ROM2_>--------------------------+    +--------+-----+--------+
                                         |    | Chip   | +5V | Ground |
                      74F138             |    +--------+-----+--------+
                  +--------------+       |    | 74F138 | 16  |   8    |
(11,52)    A23>---|a0(1)   q0(15)|o-     |    | 74F08  | 14  |   7    |
(10,51)    A22>---|a1(2)   q1(14)|o-     |    +--------+-----+--------+
(09,50)    A21>---|a2(3)   q2(13)|o-     |
                  |        q3(12)|o-     |  _______
(12,06)    AS_>--o|e1(4)   q4(11)|o-     |  \      \  74F08
(08,48)    A20>--o|e2(5)   q5(10)|o-     +--o\a(1)  \
(55,09)   R/W_>---|e3(6)    q6(9)|o-         )  y(3))o--------> CE_
                  |         q7(7)|o---*-----o/b(2)  /
                  +--------------+    |     /______/
                                      |
(31,10)  DTACK_-------1N4148------>|--+
```

Figure of the 1N4148:

```
                       +----------#-+
DTACK <-- =============| 1N4148   # |============ <-- output from q7
                       +----------#-+                (and b2 on the
74F08)
                                 /
                    Cathode Mark/
```

The current can only go in one direction: From the output q7 of the 74F138 to the DTACK on the motherboard, but not the opposite way.

Also, the 74F08 can (but doesn�t have to) be replaced with a 74LS08. Or use one of the two unused 3-input AND gates of the 74LS11 on the motherboard.
Not all motherboards are equipped with such a chip. Atari uses them for encoding the three ROM select signals into one, when using only two ROMs for the operating system.

In this case you�d need to tie one of the inputs to +5V, since you only need two of them. You have to see for yourself which gates are unused, since this differs from revision to revision.

Figure of the 74LS11:

```
    +---\_/---+
1inA|1      14|+5V
1inB|2      13|1inC
2inA|3      12|1out
2inB|4      11|3inC
2inC|5      10|3inB
2out|6       9|3inA
 GND|7       8|3out
    +---------+
```

The three 3-input AND gates of the 74LS11 are designated 1,2 and 3. The three inputs of each AND gate are given letters A,B and C.

Let�s look at a sample solution where gate 3 is available:

```
       74LS11
    +---\_/---+
    |1      14|+5V -----+
    |2      13|         |
    |3      12|         |
    |4      11|3inC <---+
    |5      10|3inB <------ ROM2
    |6       9|3inA <------ output from q7
 GND|7       8|3out -------> CE
    +---------+
```

You must always make sure that the gate you want to use really is free and not used for the abovementioned ROM select encoding! Sometimes the inputs are all tied to either +5V or GND. In that case you�d have to break those ties.

Does the MegaST have a TV output? Maybe you could use that instead (and as Martin said, swap with someone uninterested in mono).

By the way, both the monitor and computer were properly turned off when you plugged it in, weren't they? If not.. then it might be pent-up current sparking across and doing something unthinkable.

Anyway, there's always lots of used (and frequently abused) STs going cheap in my local paper - check papers in your area for similar stuff. Maybe you could cannibalise a GLUE from a different machine, assuming MegaST chips are similar to plain ST chips and you are good at soldering.

Good luck, from someone who thinks he just might have buggered up his own monitor port with some dodgy soldering. :)

EddyH
(if anyone can help with my predicament it would be nice too.. STf 1040, tried putting some composite video ports on it when my CM8833 died.. I messed it up of course. I think the red, green, blue and audio outputs are working but nothing else, no sync or anything.. argh!)

Well, I tried and succesfully installed the high-density hack for my Atari 1040STf.

I clipped the clock pin on the floppy drive controller (it was a VL1772-02PC - anyone know any specs on this particular chip?). I jumpered a wire from the 16mhz clock pin on the Shifter chip, and a wire from the 8mhz clock pin on the DMA controller. And then I jumpered a wire from the now-clipped clock pin on the floppy controller. These three wires went to a SPDT (single pole, double throw) switch. Now, I can switch from from High Density to Double Density modes.

Any comments?

The one problem I'm having is having to juggle utilities and boot sectors to make sure I get the drive set to 6ms steprate. Anyone know of a circuit to do this?

As it seems, I have an abundance of high-density disks, and a dwindling supply of double density disks. Anyone know of a good commercial source for these?

Now that you've done the most delicate part, you can try autoswitching
using a logic chip and the HD detect signal on pin 2 from the drive.
There are circuits like this at

http://www.geocities.com/SiliconValley/Way/8016/atari/sthard.htm

>

This is a TOS setting, so it can't be done with hardware.

> As it seems, I have an abundance of high-density disks, and a dwindling

I can still get them from my local supermarket, but the stock is
decreasing.

It closed abruptly after what I understand was a massive hardware failure. I was a downlink for FANfiles from Paul's system and I was equally unaware of the closure, calling the number daily for a fortnight!

Hi,

Please can you tell me if NVDI 5 also has drivers for HP Printers such as
Deskjet 670 and 690C ? If not is the new version of MakePRN powerful enough
to built one ?
Thanks a lot !!

Vincent

Because of the increasing difficulty in finding DD diskettes
(and HD can store more), I'm thinking of upgrading my Stacy.
However, I'm wondering how to move the cover plate and button
towards the new floppy drive. Any hints on Stacy HD upgrade?

***

Also, I have a defective SF314 (the drive itself seems to be
kaput) which I would like to upgrade to HD as well. Can the
SF314 circuit handle HD drives, or is that entirely dependant
upon the presence of an AJAX chip in the host computer?

You can use the header "Followup-to: " for this purpose :-)

ex.: Followup-to: comp.sys.atari.st.tech

(not all Atari softwares support this easily, Okami does)

Hi!

I have a Crystalscan 1024 NI from Gateway 2000, last used on a 486
multimedia system. This monitor works fine-it should
work with no problem on the Falcon correct?

Regards,

Jim

Jim,

Check out :

http://www.uic.edu/~tbrann1/Gateway2000/MonitorFAQ.html

I have the 1572 and the info on the page was useful.

And yes, it should work fine on the Falcon.

Dan

I don't know what the Koala pad is exactly, but if it's some kind of touch pad with a serial mouse style interface, then you could always use my Atari Serial Mouse Interface (see my WWW page). However I may be quite wrong about what the Koala pad is, so it may not work with the interface at all.

Just cut the plastic cover with a knife.

Also, I've never had any problems using high density discs in a double density drive, although I have heard that this can result in less reliability over time. I am not really familiar with disc drives, so I don't know whether this is true or not.

: Also, I have a defective SF314 (the drive itself seems to be
: kaput) which I would like to upgrade to HD as well. Can the
: SF314 circuit handle HD drives, or is that entirely dependant

As far as I know, the SF314 would be no different to any other external drive, i.e. it has no circuitry in it apart from the standard disc drive mechanism. If you put a high density mechanism into it and upgrade your ST suitably (or use it on, say, a TT which already has high density support (although earlier TT's did not include this)) then it should work fine.

: Crossposted to comp.sys.atari.st & comp.sys.atari.st.tech but

You could set Followup-To: in the article header to refer only to comp.sys.atari.st.tech. Then followups would automatically go that group.

Mario,

I have heard of your Atari Serial Mouse Interface (from your page). Although, I am not sure that the Koala Pad has a normal serial interface.
What I do know is the Koala Pad is a rather old touch pad. I used it on my 130XE. It has two large buttons, and a 9pin Atari joystick/mouse connector.

If you press the buttons you can somewhat move the mouse pointer in the +/- vertical directions. However, I did try installing a driver that allows you to control the mouse pointer via a joystick. If I plug the Koala Pad into the joystick port and install the joystick driver, the left
and right buttons move the mouse pointer in the +/- horizontal directions.

Thanks for the help though.....I am looking for any info that's out
there...

-> Chris

:Does the MegaST have a TV output?

No, but you can, via a RGB--SCART cable, still connect to
a TV with SCART (also called EURO AV).

:(if anyone can help with my predicament it would be nice too.. STf
1040,
:tried putting some composite video ports on it when my CM8833 died.. I
:messed it up of course. I think the red, green, blue and audio outputs
:are working but nothing else, no sync or anything.. argh!)

Does your 1040 have a TV-modulator? If yes try to connect it to a TV
that way.

Do you have a friend with a similar computer? Go to him and use his
cable and his monitor, to see if your GLUE lives. While you're at it
bring along your monitor and try connecting it to his computer.

The CM8833 has a lot of switches I believe? Try throwing them...

Good luck!

:
:This is a TOS setting, so it can't be done with hardware.

Actually it can. I have a description somewhere around here...
But why bother? It's so much easier to have a program do that
for you. When the program is executed no extra memory is
occupied, since changing the steprate only means that the
value of one single byte in RAM is changed!

Stick to the software solution!

You could also change this value directly in the TOS ROM:s,
meaning you'd have to get an extra set of EPROM:s in which
to store this patched TOS version.

I've done that and it works extraprima!

However, I only did this to my swedish TOS 2.06, didn't
bother about the others. When messing with TOS 2.06 you
can't just go in and rearrange stuff, you also have to
provide the right checksum at the end. If you speak
"assembler" that should be no problem since the checksum
routine also resides in the TOS ROM:s!

Can anyone tell me about Practical solutions, tweety board for ST.
Can it be used in Mega ST?
Thanks Ken M

Hi Ken. I've got a Tweety Board that I picked up for cheap, but have
never installed. According to the docs that came with it, yes you can
install it in a Mega. Hope this helps! ;-)

Hi

Don't tell me, it hisses. Well all cats hiss don't they. I've had 3 Jaguars
and they all do the same. I think it was a design fault, possibly down to
the frequencies that are floating aot the components.

I get quite a few 720k disks that get discarded because they are no good to the PC users. They have been used (usually exactly once) and I just reformat them. Often I get the Digital TransLAN software disks (RX24K). Anyway, I've never had a failure.

I think I've got about 50 surplus at the moment if anybody wants them and is happy to pay for shipping from Western Australia.

Depends where in the world you live. (I find email addresses that end in com annoying because it doesn't say where you are!!!!). ;-))

In the UK I last got DS disks from an Office World shop. They were 3M branded disks too! That was about six months ago, but they do have a good range of computer media.

I now have a Falcon which uses HD disks, so I won't be needing DS anymore. :-))

Cheers!

James

The only problem with the above statement is if you should happen to trade a disk with a friend or anyone else who does not have a HD drive, what are you going to do than? 720K disks still have their place. I do suppose you could always cover the extra hold to make it a 720K disk

Sorry, they have a smal board backside for the floppy plugs.
I'f you mean any other external SF drive, right same parts inside.

On this board Drive A and Drive B select lines are difficult
to handle. The case is usable for a normal 1.44 HD drive as 720K

Standard atari floppy cable and plugs miss the hd-signal wire!

Regards, Robert

Hisses? The sound is more like cross town traffic, or an angry
swarm of bees...

This sure can't be normal?

No idea how to remedy this?

Anyone have any schematics for the Jaguar?

Can you still buy the Tweety Board? If not, a reverse engineering project
should be in the works. Us older Atari hackers could benefit from this.

There is a WWW page somewhere with schematics for a number of Atari
computers including the Jaguar. Unfortunately I can't remember the URL for
it, but maybe you will find the page if you use one of the WWW databases
and search for Atari schematics, or something similar. Otherwise I have
the Jaguar schematics from that page here and could email them to you.

Floppies switch between DD and HD according to the second hole in the disk
(the first being the write protect).
2 holes -> HD disk
1 hole -> DD disk

Therefore, you can turn a HD disk into a DD one simply by masking the HD hole with tape.

You could as well turn a DD disk into a HD one simply by making a HD hole with a drill, but you could damage it. Anyway, it's not a good idea since the magnetic coating is just double dendity, and it might not handle correctly high density signals (not even thinking of the plastic dust due to the drill that could damage the coating)...

By the way, all HD drive don't send a HD signal on their pin 2. I had to sold a wire directly on the HD switch on the drive to get this signal. It WAS NOT on pin 2... This is because PC BIOS doesn't use that HD signal : it assumes that a HD disk is in the floppy. So, it first turns HD mode on, and if it can't read the disk, then it turns HD mode off (<-> DD mode on) and if it still can't read the disk, then it's a faulty disk.

Bye...

Assuming it's a VGA monitor, it should work fine. All you need is to make (or buy) a VGA adapter for the Falcon. AN easy pin-to-pin job.

Nick

Hiya,

as there are quite a lot of people around here who know something about
Atari monitors and often occuring problems:
I have an old SM125 colour monitor which keeps blowing one of its fuses
after a few seconds, after which the sound it normally emits (which most
people can't hear anyway) lowers somewhat in pitch.
Anyone got a clue as to what could be wrong with it? I guess I could run
some tests on it, but I don't know where to start...
Thanks,
     -=Levien

I'm having the same problem with my SM125.......there must be a way. My

service mand refuses to fix it because he had the csame problems that
you mentioned.
I'd certainly like to get it fixed....it is far superior to the SM124,
don't you think>?

Hello!

I'm looking for the place where I can find:

- COMBEL chip,
- VIDEL chip,
or
- complete motherboard for Atari Falcon.

Also, I'm looking for schematics for Atari Stbook.

please let me know if you know anything about it...

sasha (stbook)

Eh!? SM125 colour!! I don't believe it.

Anyway, it's obviously a power supply problem and the most usual fault
is that one of the large electrolytic capacitors is shorting. Look for
one of them 'bleeding' over the circuit board and replace it.

Thanks to all who helped me get my Atari connected to the
internet. In fact no doubt thanks to some decent tips I
managed to sort it no problem at all. Not sure about Newsie
though, is there a nicer email only freeware package I can
use. Whats the best text editor to use with newsie anyway?

Anyone have experience with upgrading TOS to 2.06 on a 1040STf? (Revision D motherboard). I have seen some project files on The Atari Hardware Hack page (greets to the Vezz), just wondering if anyone here had actually attempted the TOS switcher project (where you can switch from one TOS to another).

Hehehe, got Kev just where we want him! <smile> Seriously, the Tweety board was a 3rd party card that plugged into Atari ST's with the Yamaha sound chip. It brought 3 channel, stereo sound out via RCA cables (I'm not absolutely positive about this-I'm recalling from memory). It just plugged onto the top of the ST's old soundchip. No soldering, IIRC. It was supposed to make regular sound much better (esp. music) but it did not do as good on samples. Still way below what your STe does, mate! ;)

Anyways, I hope that helps. ;-)

Hi all, I am working a bit at Atari NOS, I modifyed some bits to make able to attach various interfaces to the serial ports, I am now able to connect to the net on serial2, and have a ppp direct link on modem1 and so on, tought adjustiong the routing is still a nigthmare for me, has anybody some documentation that could explain how to set up link between local networks, ppp links and internet, routing, netmask, broadcast with examples ?

I am able to connect on one serial port to a win95 with a serial direct ppp link (tought still to find out how to auto-skip modem commands on w95) and I connect to internet (fixed IP) with another port.

How should I set up NOS to make it part of the local network and make this part of the internet with "masquerading" or multiple IP address ?

BTW, if anybody need this test-version of NOS, please ask me specifying 68K or 68030 version.

Is there any source available for win95 about setting up an IP link with ppp

```
so that I can skip modem commands or communicate on other ports (parallel) ?

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

There are specific drivers for the two printers you mention - MakePrn isn't
included with NVDI5. The new drivers are PCL rather than bitmap drivers
AFAICS so it wouldn't be compatible. ICBW of course.

First, keep a look out on these atari news groups - there are often
host adapters for sale.

I'm not sure what country you are in but the latest h/a, Link 97, is
fairly easy to obtain. In the UK you would go to Systems Solutions.

Not that I know of. But I have the jumper ok for the TT and the STE
is only 1 jumper different.

 j2 to j6 near the word atari jumpered to the side with the j-s so
 pins on atari-word side are empty
 they tell to use BNC or AUI. You want to used coal cable isn't it?

 jumper next to part fuse m 1a250v and next to ut 12102 um 9044 chip
 empty (called J7)
 jumpers j17 to j 24 all onb for TT for STE all open (adresssing of
 card it seems.

 near vme-connector: j8,9 and 10 for unknown Only the middle one is
 not-jumpered.

That is still the latest version.  Sad but true.  There's 1 or 2 'hacked'
versions of TOS, but that is the latest 'official' version.thanks

My Stacy defective hard disk killed it power supply. The orignal Conner hard disk
was
jammed and it apparenly killed the power supply.
```

I have changed the hard disk but now the power supply doesnot have enough power
 to drive the Stacy. I could make my Stacy working with other 12 Volt transformer
whereas
 the Stacy power supply is 14.5 Volts. Therefore the screen is very dim.

Is there a possibility to repair the Original Power supply? WHich components are
likely to cause
the power dropped in the power supply unit?   (I am quite handy in reparing and
soldering).

My Stacy is the first released model which has a space for battery but no
terminals or connectors
there. Presumably Atari could not find a suitable battery for the computer at that
time.

With today, more advanced, technology is it possible to find a suitable battery
for the Stacy?

Any advice, clue would be much appreciative.

Hello All!

This is to announce my new web site created on the Penguin Pro
It is basically an Atari Midi site with some midi files to
download and Tips on using Atari sequencers and such. I am still
working on it, as HTML is new to me..a never ending process.
However I am happy to contribute to the Atari community. Check
it out at:

http://atlantis-bbs.com/dconrard/index.htm

Tim's Atari Midi World

I would appreciate any comments..even if they are "Painful"

Search out Systems for Tomorrow. I think that they carry the latest
SCSI hardware adapter for your machine. They are located in the U.S.

So you are still getting DC power but it is low?

I would suspect the rectifier in the 12v (14.5v?) line which will have
been overdriven when the hard disc jammed. It will probably be a 3-pin
device with a heat-dissipating tag on it and should be easily
replaceable although, often, unsoldering is a nuisance.

I have begun a project which (hopefully) ultimately answers the question of how we can use the mammoth amount of space available to us on the PC for the Atari. This comes after a long, and lonely vigil trying to use GhostLink and some other parralel/serial port filecopying programs.

I began thinking - how hard would it be to attach the ACSI harddrive port on the Atari to the parralel port on the PC? The parralel port is fast, bi-directional, and well-documented on the PC. The ACSI has _some_ documentation. More could be gained from some of the various sources here on the Net.

The end goal would be to, through a piece of software on the PC, connected to the ST's harddrive port, fool the ST into thinking that a harddrive, all formatted and ready to go, is on the end of that harddrive cable. When, in fact, it's a PC emulating all the signals that a normal harddrive would send back, and would transfer data in and out.

Here a few considerations:

1) Is the data going through the ACSI (Atari harddrive) port digital?
Would it be necessary to do any electrical conversion?

2) What are the partition limitations on the ST? Would these be the same
in this configuration?

3) Would it be possible to boot from this device? If you can boot from an ST harddrive, you could boot from this.

Any thoughts? Ideas? Offers to help?

I don't think it's a good idea to use polish in an international forum.

Maybe you could try again english.

Cheers,
Nick

I would guess that it would be quite hard. But ACSI<->SCSI adapters are commonplace, so why not a SCSI Ghostlink? Can a PC SCSI card be made to act as a slave rather than a master?

Why not an Atari parallel port Ethernet adapter? Using ParCP I have got up to 6 meg/second between the Atari and the PC running WINge 95 - although I've only used it twice so far (I have to try it under Linux yet). ParCP in the trial version only shows you 15 or 16 files, but you can copy subdirectories pretty damn quick.

Using the same techniques, why not get the parallel port talking to an ethernet device and run a 2 megabit link?

regards

Steve

Ideed there are. In germany there was a firm selling them. Special
Litium stuff for much money (DM 400 or $200.
The technology is there but the money?

Hi All,

I plugged an SM14 monitor into my Mega ST4 tonight. I suspected the monitor was not quite healthy but did not realise it was feeling murderous!

I got no display so unplugged it and replaced a known working SM14 and RGB mon. I seem to have killed something in the Mega as I get a rolling display which seems to have no sync.

Grrrrr!

Does anyone have any suggestions about what I might have blown?

Help :-)

If memory serves me right, GLUE chip's sync signals go directly to monitor port, without any kind of buffering.

It could be that monitor generates higher voltage which kills GLUE...

Regards,

Branko

I'm looking for a printer driver which will allow me to print in colour on a Canon BJC210 (I can print in B&W using the BJ10e). Canon says such a driver does not exist. Can anyone prove them wrong?

thanks

Mave

I like Ghostlink as well. It works very nicely. However, I have the desire to execute programs through this link. And Ghostlink does not do this. I have a feeling that the author would have included it, had he continued to develop the software. Perhaps I can save myself a lot of effort, and dig up the author, and get a copy of the source code. This way, I could just hack it until I get it the way I want it. Let's face it - Ghostlink is just about perfect for this need. And, hell, who needs a harddrive on the ST if this works.

I'm not sure, but I don't think I understand your proposal here. But, you know, it wouldn't be hard to emulate a harddrive on the well-documented SCSI interface.

The whole goal of the original project was to render a connection that would require no loading of special software on the ST. The connection would be like a real harddrive, and give you the benefits therein. There's already an Atari ethernet adaptor project on the web.

Thanks, Branko.

I have taken the top off the Mega and can see what you mean. It's
significant that the signals which seem to be missing are mono +syncs
which are exactly the signals connected to the bad monitor. Looks like
I will have to find a new GLUE :-(

It seems a bit bad that a monitor will generate voltage levels on the
INPUT lines which will destroy the chip driving it. I wonder what is
going on inside that bad monitor?

Hi all,

After 10 million or so uses my trusty internal ST floppy drive has ceased to work. I've tried to hook up my 1.4Mb Pc drive but it doesn't seem to work (although it should?). I was wondering if anyone has a pinout specification of the ST floppy and/or the PC floppy and any idea how can I make it work in my ST. Buying Atari (or even Amiga) drives is almost out of the question over here in Greece.

Thanks

Hi!

What type of port is the SCSI port-is it 25 pin or mini
50 pin?

Regards,

Jim

You can use any ordinary high density disc drive (as used on the common IBM compatibles), however without other modifications the ST is unable to take advantage of the extra 720K of a high-density disc.

Note that the cables on the high density drives tend to be reversed compared to the double density. You may simply have put the cable in thew wrong way up (fortunately this is usually not fatal, just reverse it and it should work). Check the pin numbers printed on the drive. The edge of the ribbon cable marked with a red line should go to pin 1.

Otherwise, there can be problems detecting media change. Although this will not prevent the drive from working, it will mean that data corruption can occur when the computer doesn't notice that you changed the disc. If this is a problem, you can short the disc change microswitch in the drive to fix this problem.

```

Thanks a lot Mario, although if my memory serves me well i must have tried
putting the ribbon cable 'the wrong way round'. I'll try again.

Keep up the good work
Kostas Nakos

HI

You should be able to use a standard PC 720K drive without any problems, you
may have to cut your ST casing.

--

Cheers! for now
Steve

In the PC drives are switched from 'normal' 'to 'super' by the
computer. Mostly they use pin nr2.
Sometimes the drive has a jumper: goto 'high if signal voltage is
low' is mostly standard. But sometimes the reverse is set.
If your cable from the ST brings line 2 down, maybe the drive then
thinks 'super' en goes to 1,4 Mb mode.
Them he does not work.

Met vriendelijke groet,
Ronald van der Kamp

Roger,

Before you leap too far..........

Have a look at the pins on the suspect monitor. It may very well have
damaged your monitor socket.

For Sale:

One Atari 520ST
Two Atari SF354 floppy drives
One Atari SC1224 color monitor
Two Atari SM124 monochrome monitors
One Astra SW2 monitor switchbox
One Atari mouse

All cables and accessories

Big box of Atari ST software on both single sided and double density disks

Several Atari ST technical and programming books from Abacus

ALSO included is an Atari 1040ST that is presently not working, but I just believe it needs a new floppy drive.

Best offer with shipping takes all

These are rather hard to find these days and tend to cost more than a used ST, so the best way to obtain one is to get an old XT with a floppy; these used to have DD drives. At least here they are given away almost free, as they are no use anymore. Nice this PC world. In addition, you get lots of interesting electronic junk to occupy your cupboards :-)

You may have to set some jumpers on the drive (ID select probably), but it's a job of try and see; no harm done (usually...)

Markku

Hi folks,
anyone know how fast you can get data to and from the cart port of an STe? I want to build a 4-track D2D cartridge, and need to know wether it is possible for it to play back 4 x 44kHz from hard-disk while recording 2 x 44kHz to hard disk (or possibly playback 2 while recording 2)...can it be done?

Hi, everyone!

My SM124 has a harmless but annoying fault- the picture gets slightly bigger (by about 1mm, mostly in width) when brightness is increased. This happens both when the brightness pot is turned and when the screen picture contains a lot of white areas- in this second case the picture gest wider mostly in that part of the screen that has a lot of white, and, therefore, distorts a little.

The SM124 that I owned some years ago with another Atari machine did not exhibit this "feature", so I know that it CAN work better than it does now.

Someone has told me that this fault is probbably caused by a dried-out electrolytic capacitor. However, there are quite a lot of them in the monitor, and some of them are not easily accessible in my monitor (e.g. the little board that fits on CRT-tube neck is glued to it and the wires that go to the main board are rather short and soldered to boards at both ends). Just for a trial, I have replaced several of the more-accessible electrolytes, but to no effect.

I would appreciate any help, comments or pointers concerning this little problem.

Btw. my SM124 is the version with a switcher power-supply (no transformer) and the horizontal-stage electronics tucked in a single-in-line chip (no individual transistors). Therefore the scanned schematics of the SM124 in the .IMG format that can be found on some sites is not appropriate for my monitor.

Greetings.

I know nothing about monitors, but I have observed this problem in just about all monitors, including brand new VGA monitors. Many of them are much worse than 1 mm, for example my expand or contract by about 1 cm (at a guess) when the brightness changes (it always did that from when it was new).

I believe that this can be caused by the power supply not quite having enough headroom. You would probably only be able to confirm or deny this if you were to measure the power supply output with a dark screen and then with a light screen and see if the voltage drops significantly.

I saw a PC monitor that exhibited this same behaviour and was fixed by replacing one resistor. Apparently the resistor was getting too hot (design fault). A resistor with a higher power rating was used in it's place. Not that this story helps you in the slightest :-)

Hello,

I think I can help you, as I run the Portfolio Club in the U.K. We have over 80 hardware and 600 software items in stock, we also buy and repair Portfolio's. If you would like a copy of my clubs latest eight page price list as well as details about the club, please send a S.A.E (Stamped Addressed Envelope) A5 size (approx 160mm * 230mm) or larger to:

Portfolio Club (U.K)
16 Cedars Road
MORDEN
Surrey
SM4 5AB
U.K, England

Or leave a message on our clubs answermachine, or send a fax:
Telephone & Fax(Home) +44 (0)181-286-8990

E-mail:paulfinch@x-stream.co.uk

Hope the above helps!

Paul

We MUST keep the Atari Portfolio Alive!

P.S. Visit our clubs stand at the AMP 98 Computer & Electronics Show (including the Atari Show) on 14th November, 1998 at Bingley Hall, Staffordshire Showground, Weston Road, Stafford, England. Between 10-4, only costs �3.00p admission. Lots of bargains to be found!

I believe that NVDI 5 has drivers for this and other BJC printers. Also I think imagecopy was going to support them in its next release. The only problem is that NVDI 5 costs 60ukp.

Hope this helps

Niall

Is this absoultely neccesary?

I have found a lot of messages with this crap info on the end, even if the
message is different.
If you are going to advertise, do it in the proper channels and not like
this. It's irritating, it sucks, and people do not like it.

Reading and writing is always done by the hard disk driver, i. e.
HDRIVER, because other drivers don't support the LS-120. This also
applies to floppy disks if used with the LS-120.

Note, however, that I wasn't able to format any medium with the LS-120.
It even refused the most simple format commands you can think of.

That's correct though with HDDRIVER 7.5x you couldn't map those drives
to the IDs A: and B:. This can be quite useful, especially for the
LS-120, and is supported by HDDRIVER 7.6.

IIRC, it has been on your to do list for a couple of years now, hasn't
it ?

That's wrong. I have one in my STE. The TUS IDEal board connects to the
square socket PLCC 68K chip (that's why it's STE only). There are 4
additional wires to connect, an activity LED, and that's it. It doesn't

interfere at all with the cartridge as far as I (and my cubase dongle)
can tell.

Cheers,
Nick

I've yet to find a VGA monitor that gives the comfort of an old SM124.
It had a very crisp paper white display, with no flicker. I don't know
what it is that makes the difference, but you can't get the same effect
on a VGA screen.

I suppose the settings you are talking about are for the huge black
border all around the screen. The reason for this was that Atari wanted
to have exactly the same size ratio on screen as on printouts from the

SLM printer. Not such a silly concept if you ask me. It can be changed however.

Cheers,
Nick

No trying to be picky or anything, but wasn't it called "ST-Amiga Format"? I seem to have some vague anecdote in my head about "Saint Amiga"...

I have one of these beasties that has served me well over the years (as well as a sc1435 that I picked up second hand :) but that big black boarder does annoy me. I do recall seeing somewhere how to fix it but can't recall where or what it was.

How do I fix this? Keeping the aspect ratio is a good thing, however I don't need a left and right margin of 3/4" and I'm now getting a bit of trapezoid shaping too.

regards

Steve

Its an expensive route but I suppose you could go for two quarter height mechanisms, one notebook size LS120 and a notebook type 1.44 floppy drive. That way you could have both fitted simultanously. Ages back I thought about fitting two such floppy drives in place of the one normal 1.44 high density drives.

Would I be right in thinking that the LS120 drive is a lot slower than a Zip drive especially the Plus model. Admittingly it has 20MEG more storage and of course normal floppy functions.

If LS120 drives are half as reliable as the earlier floptical drives there worth considering. I've got 35 flopticals all a few years old now and I've yet to encounter a bad sector on any of them. Mind you there only 21MEG each. Obviously LS120 is six times the density . I've known quite a few people with Zip drive problems at least in the early days of Zips.

Does anyone remember the Digital Master and Digital F/X audio I/O rack-mount boxes that connected to an ST via the catridge port and were used for digital audio recording around the early 90's? They were made by a company called Hybrid Arts (and later changed names to Digital {something}) and are now out of business. I am looking for anyone that has one of these or, better yet, anyone that worked on these as products or hacked them.

thanks,
mike

What about modifying the PLIP-driver under i386-linux that works the same way as Atari-PLIP? That sounds like the easiest solution, provided you know how to write kernel-modules. :)

:>Sounds like you've found one of the TOS chips?
:
:On my STE, the FDC is marked as C302096-001A. The TOS ROMs are
C301165-002A
:and C301166-002A.

Mea culpa, I was being number-blind...
I always thought of the Ajax chip as the only one with a big "Atari"
inscription on it.

If the FDC seems to be at fault in an STE, the first thing (and the cheapest) to check is the 74LS06 buffer chip right behind it, almost hidden by the floppy ribbon cable. Carefully snip it away, clean the holes with a solder-sucker (don't know if that's the proper word?) and solder in a socket into which the new chip is pushed.

It should cost you only a few cents, (or pences or whatever...) so even if it wasn't that chip, you can eliminate it from the list.

yes, 68882 and 68881 any speed will work. but be aware a 20MHz 68882 and a 33MHz 68882 are same speed as they're clocked externally from the falcon. to get the highest performance of your fpu you'll have to redirect the clock signal for the fpu.

cheers Henry

Well, I'm thinking of giving up the Atari (just can't get to Linux, no time). So, if you are interested, please let me know what you'd be willing to pay for my CaTTamaran system. I also have a few items I'm selling separately (prices don't include shipping, if you don't like a price, feel free to make an offer):

Floptical and 5 21 meg discs (internal)	$ 75
105 meg Quantum LP105S SCSI HD	$ 35
w/ External SCSI case	$ 50
Maxtor 40 meg SCSI HD	$ 15
w/ External SCSI case	$ 30
NEC 3Xe external CD-Rom drive	$ 50
All Things Falcon CD	$ 5

TT system:
TT030 10/16
48 MHz CaTTamaran
Nova ET4000 1 meg card w/ v2.08 drivers (fitted inside TT, up to 800X600X32K) 40 MHz FPU (Motorola never supported over 32 MHz officially in PLCC, but my distributor got one from Motorola that was tested to 40, which I needed to get the CaTT stable)
TOS 3.06
HD floppy

You can't put a hard drive in the case because the stock power supply can't handle the accelerator, RAM, Nova, and a hard drive.

I also have an external tower SCSI peripheral case and Calamus SL,

ExtenDOS, NVDI 4.11, and much more software that would go with the
system.

There are two adjustments inside the SM124 monochrome monitor to change the picture size.

Unfortunately it's been so long since I had mine open to do this I can't remember the exact locations of the controls. You can determine the proper one by experimentation, if you're brave.

(There ARE documents explaining how to do this, and it would be best to get one before mucking inside the monitor. Remember there are LETHAL voltages inside a monitor/TV, and they can kill you even when the power is turned off. Check on the atari.archive site to see if they still have the document.)

The vertical size adjustment is done with a miniature potentiometer mounted on the main circuit board. I don't remember how many pots there are on the board, or the location of the proper one, but you can try turning any of them with a small screwdriver and observing the screen. First note the position of the knob BEFORE you turn it, and if it doesn't make the screen get larger or smaller vertically, turn it back to where it was and try another one. You can't hurt anything by turning any of the adjustments.

Once you find the one that makes the screen bigger and smaller in the vertical direction, just set it as big as you like it.

The second adjustment is easier to find, but harder to do.

The horizontal size is controlled by an adjustable coil, and there's only one so you can't mistake it. It requires a special tool to turn the iron slug inside the coil and adjust the width of the picture. The tool is plastic (a metal tool will distort the picture) and has a small hexagonal head on it. You CAN use a small metal screwdriver to turn the slug a little at a time, then remove the screwdriver to see what the results are. (We're talking SMALL here, like the largest size of a jeweler's screwdriver set).

If you're not sure what you're doing, don't do this! Find someone who knows what the inside of a monitor or TV is like to make these adjustments.

Remember, one more time, this can kill you if you touch the wrong thing.

There used to be some discussion that changing the picture size would shorten the life of the monitor. Not true. Mine has been enlarged since I got it over 12 years ago and is just fine.

Remember also, changing the size will change the aspect ratio so the screen doesn't match printouts. A circle drawn on the screen will appear oval if you move the edges all the way out. If you care about this, you can display a circle on the screen while you make the adjustments and only go as far as you can without distorting the circle. For games and text work, it doesn't really matter.

One last time, this can kill you. Be careful!

BobR

I was told a while ago why this isn't very clever (or even possible),
IIRC it had something to do with interrupts.

Hmm, that's just been added to my 'to do' list. My floppies been dead for around 3 weeks now and I'm getting really p*ssed at having to use my 3010 as a disc-drive, especially since I only get 3300cps over a 57600bps link. Of course, if it's the FDC that's failed, instead of the 7406, I'll stick with a serial link as a replacement FDC is as much as I paid for a second hand ST :(

>It should cost you only a few cents, (or pences or whatever...) so

I hope it is that in my case, then I can get back to using floppies on this machine without having to go through another machine to read them.

Can anyone help me with my power supply problem on a Atari Mega St2?

I've experienced the following problem during the last days: on my Atari Mega ST2 I've got some strange noise from the fan that indicated a slowdown. After a while it stops working and I cannot restart it.

.) when I switch on the Atari nothing happens...
.) after a while I can boot from the system disk and the above problem reappears

After opening the case I experienced the following things:

.) I recognised that the power supply works reliable when the board (and the floppy) is disconnected.

.) If I'm connecting the board and/or the floppy, the system (and the fan) doesn't start.

.) When I connect the board power cord after switching on the power supply, the fan speed is increased.

.) If the system is running (with floppy and board connected to the power supply) it happens to stop sometimes after a few minutes.

I'm using my Atari for music processing for years and I don't want to switch to a different OS.

Please help!!!

Thank you,

Andreas Mayerhofer

>
> This is how the C-Lab kit works, but I have to say that external units should *not* be connected to the normal SCSI-connector. I haven't been able to get this working in my Falcon, SCSI doesn't work at all unless I just terminate the external connector and connect everything to the internal bus. The solution is simple, connect a SCSI-connector (50 pin Centronics-type) at the end of the internal bus and mount it somewhere on the back of the Falcon.
>

The reason you can't use the external bus with the SCSI cable hacked to the underside of the HD50 connector is because you can't "fork" the SCSI cable, which is what you do when you hack in. The host has to be properly placed on the cable. You can get away with hacking into the terminator bus because this is legitimately on the internal chain, but you must terminate the end of both internal and external chains.

It sounds like your PSU is getting weak. You should probably look into getting it replaced. You could probably use one from an old cheap 520STF. In the meantime, you could try removing the fan to reduce the load on the PSU. An STF/STE has no fan and no overheating problems, so I don't see why a Mega ST with no extra hardware would really need a fan. Besides, in a music environment, you'll find it more pleasant to have a quieter machine.

Cheers,
Nick

At least on some circuit boards these are clearly printed as VSIZE etc.
If you know what you are doing (you should) you know what to look for.

> There ARE documents explaining how to do this

Try http://www.geocities.com/Silicon Valley/Way/8016/atari/sth_vid.htm

> The vertical size adjustment is done with a miniature potentiometer

> The horizontal size is controlled by an adjustable coil

I remember seeing some with a pot labelled HSIZE or something. I did adjust this one without touching the coil...

And say it one more time. 10 000 volts kill you fast. This is not for a layman.

> There used to be some discussion that changing the picture size would
> shorten the life of the monitor. Not true. Mine has been enlarged
> since I got it over 12 years ago and is just fine.

I've also heard claims that this operation would blow the famous 2.2 uF capacitor. Haven't noticed any difference, though.

> Remember also, changing the size will change the aspect ratio so the
> screen doesn't match printouts.

And while you/your TV engineer are at it, also check the focus adjustment. Watch the icon labels when turning it and notice the difference!

Atari power supplies are fairly robust BUT the soldered joints in them really take a beating because of the heat and the associated expansion and contraction which causes intermittent power problems as electrical contacts are made and broken.

Most of the problems I have had with power supplies are due to "dry joints", which appear as circular "cracks" around a component. Once you resolder the connection, the problem usually disappears.

My advice would be to unscrew the power supply unit from the base *VERY CAREFULLY* (there are some *VERY* high voltages involved), and then turn it over and inspect the bottom visually for any "cracks" or completely empty solderless holes with only a wire sticking out (which, believe it or not, has also been known to happen). Resolder the joint(s) and *REASSEMBLE* the power supply (not forgetting the plastic piece between the base and the unit) before trying it. If there is any doubt, you can resolder ALL the connections before reassembly.

If this doesn't solve your problem, it is possible that one of your capacitors has leaked and must be replaced, or that some other component has failed. If this is the case, pick up a cheap ST at your local thrift shop or garage sale and use the power supply from it: the only difference between the MEGA power supply and the ST power supply is the shape and size of the base it is attached to.

Hope this helps,
Randy Kwak

Regarding all this talk of scan rates and pinouts and such, my website deals primarily with things of this nature. Although it concentrates on game consoles, the RGB monitor discussions are talking about the same

thing. Note that the ST's low-res colour scan rates are consistant with
a TV's scan rate, and is the same as the Amiga monitor rates as well.

For monitor info:
http://www.gamesx.com/misctech/rgbprimer.htm

for RGB/S-video/A/V info:
http://www.gamesx.com/rgbadd/caveatrgb.htm

I also maintain a mirror of the Hardware Book, which I've been keeping
updated (Again, mostly with console pinouts as well as ST stuff) at:

http://www.gamesx.com/hwb

And of course, the main page,

http://www.gamesx.com

Hope you find something you didn't know,

Lawrence.

My TT and Mega ST cases become yellowish because they were exposed to the sunlight. Is there any way to get rid of this 'oxidised layer'.

If it is not possible to clean it out, I would not mind buying a new cases.

Are the replacement cases still available?

Many thanks in advance,

:I've yet to find a VGA monitor that gives the comfort of an old SM124.

Monochrome (S)VGA:s are as good or better, but impossible to find nowadays.

:I suppose the settings you are talking about are for the huge black
:border all around the screen.

Enlarging the picture on your SM124 may damage or ruin your monitor,
be careful!

The black border can also diminish by using Lacescan, a
hardware/software

graphics extension, thought up by Ulf Ronald Andersson, Sweden.
Lacescan will give you extra pixel width and height. On one of my
SM124:s
I get 720*480, in comparison to the standard 640*400 pixels. The "new"
areas
of the screen are whiter than the "old", yellower ones. Lacescan works
in
all three resolutions. Theoretically you can get a maximum of 800*600
pixels.

Unfortunately this only works on non-STE machines. And you have to have
at
least TOS 1.2. TOS 1.4 or higher is recommended.

Some older programs won't go along with Lacescan, but then you just
don't
activate it, and all is as before.

John McDermott skrev i meddelandet
<70kvnf$qfm$3@nclient3-gui.server.virgin.net>...

:Does anyone know how to load TOS from a floppy disk? I have an Atari
520STM
:(external floppy and power supply) with a 2mb memory upgrade and TOS
1.0 and
:I would like to see if there is any improvement loading a later TOS. I
have
:downloaded a few TOS images from the Little Green Desktop site and
would

:like to try some out. Any ideas anyone ? Thanks John McDermott.

There are several TOS.IMG files that can be loaded from disk. In my possesion I have TOS 1.0 UK, TOS 1.2 SE (swedish) and TOS 1.4 SE. These are all loaded by a small routine in the bootsector of their respective disks, like a game. I don't know of any way to transscribe this bootsector loader into a .PRG version. (Anyone else?)

However, you can save the bootsector and later write it to another disk. You can also MSA pack the whole disk, which brings along the bootsector as well

There is a program called AUTO_C.PRG which lets the boot procedure continue on drive C:, pretty impressing imho!

There are also "hacks" making TOS 2.0 and 3.0 (whatever that may be?) work
via the AUTO folder. But these seem to require at least TOS 1.2 in ROM.

There is also supposed to be a German program for this, but I don't know much about it. You could also try MagiC, which is a very good alternative.

As long as no smoke has been produced mostly the problem can be cured
by soldering something.

Because of old age the electrolitic condensors go bad.

see if some (dried-up) fluid has leaked out of the big rond things.
Or look if maybe the top of them blobs-out.
Replacing them all can be a cheap and good solution.

Atari never made official TOS of those versions in a loadable state.
There where everywhere around beta-test versions for developpers to
check the working of the national TOS version.

If you do not mind removing the insides you can get rid of this
discolouration by using one of these spray kitchen surface cleaners
(Mr. Muscle, Jif etc. - the non-abrasive ones).

I have done this with a number of machines. If you can get to the bare
case you can do it all in the sink. Also fine with monitor cases,
keyboards, mice etc.
